## FOREWORD

I am pleased to submit the U.S. Department of Housing and Urban Development's (HUD) 2009 Annual Homeless Assessment Report (AHAR) to Congress. The tragedy of homelessness is faced by every community. To tackle this challenge, we need the best data available and a coordinated federal response.

Indeed, this year's AHAR is delivered at a critical moment - as the Federal government continues to shift its focus toward preventing homelessness and on the eve of the first-ever federal plan to end homelessness. The fifth in a series of annual reports about homelessness in the United States, the 2009 AHAR for the first time, captures a large portion of the economic crisis in its reporting period. It provides real evidence that the economic downturn is impacting the housing stability of low-income and vulnerable Americans - as we see a rise in family homelessness for the second consecutive year.

By adding data on sheltered homeless people for another full year, this year's report builds on last year's, allowing for a comparative analysis of homelessness that spans three years—2007, 2008, and 2009. Specifically, the 2009 AHAR draws on two types of national estimates of homelessness to provide a portrait of homelessness nationwide. The first is point-in-time (PIT) estimates, which provide the total number of sheltered and unsheltered homeless persons on a single-night in January. The report also provides one-year estimates of the total sheltered population based on information from local Homeless Management Information Systems. These estimates account for individuals who used a homeless residential program at any time during a 12-month period.
In addition, this year's report marks another significant increase in the capacity of communities nationwide to participate in the AHAR. Between 2008 and 2009, the number of communities participating in the AHAR increased by more than 66 percent, marking another step forward in our ability to collect critical information on homelessness and inform public policies. All told, this report compiles data from 2,988 counties and 1,056 cities. I applaud these communities for their hard work and commitment to helping end homelessness.

By building on the remarkable innovations demonstrated at the local level nationwide, the Obama Administration is committed to providing all Americans-from the most capable to the most vulnerable-the opportunity to reach their full potential. With essential research tools like AHAR and a new strategy that makes ending and preventing homelessness a priority for every federal agency, that opportunity is closer than ever for all Americans.

Secretary
U.S. Department of Housing and Urban Development

## ACKNOWLEDGEMENTS

This 2009 Annual Homeless Assessment Report (AHAR) was developed by a team of researchers from Abt Associates Inc. and the University of Pennsylvania Center for Mental Health Services and Research. The team was led by Principal Investigators, Dr. Jill Khadduri (Abt) and Dr. Dennis Culhane (University of Pennsylvania). Dr. Alvaro Cortes (Abt) served as project director and was responsible for leading the data collection and analysis effort. Additional team members include: Christopher Blaine, Larry Buron, RJ de la Cruz, Tracy D'Alanno, Lauren Dunton, Justin Epner, Nichole Fiore, Lindsay Fox, Tyronda Gibson, John Griffith, Mary Joel Holin, Emily Holt, Bulbul Kaul, Michelle Klausner, Joshua Leopold, Saty Patrabansh, Maura Pillsbury, Louise Rothschild, Kate Ryan, Brian Sokol, K.P. Srinath, Jennifer Turnham, Joshua Vaughn, Jeff Ward, Michelle Woodford, Matt White, and Jeff Smith (all from Abt Associates) and Stephen Poulin (University of Pennsylvania).

This year's report also benefited greatly from the contributions of a number of HUD staff. Julie Hovden and Michael Roanhouse of the Office of Community Planning and Development, and Anne Fletcher of the Office of Policy Development and Research have provided overall leadership and vision. The project has also benefited from the support of other HUD staff in the Office of Community Planning and Development, especially Mark Johnston and Ann Oliva.

Finally, this project and this report could not have been possible without the participation of staff from Continuums of Care, local government agencies and nonprofit agencies responsible for HMIS implementation in communities across the country as well as HMIS software solution providers. Their continued commitment is greatly appreciated.

## Executive Summary

The U.S. Department of Housing and Urban Development (HUD) is pleased to present the 2009 Annual Homeless Assessment Report (AHAR), the fifth in a series of reports on homelessness in the United States. The reports respond to a series of Congressional directives calling for the collection and analysis of data on homelessness.

The AHAR reports provide the latest counts of homelessness nationwide-including counts of individuals, persons in families, and special population groups such as veterans and chronically homeless people. The report also covers the types of locations where people use emergency shelter and transitional housing; where people were just before they entered a residential program; how much time they spend in shelters over the course of a year; and the size and use of the U.S inventory of residential programs for homeless people.

With the 2009 AHAR, we now have three complete years of data on the numbers and characteristics of sheltered homeless people, how they became homeless, and how they used the homeless services system. This is important, because we can begin to see discernable trends in homelessness, including the effects of the recession and of changes over time to the homeless services system.

The 2009 AHAR also marks continued improvement in both sources of estimates of homelessness used in the reports. A larger number of communities are reporting Homeless Management Information System (HMIS) data to the AHAR, which is used in the analysis of patterns of homelessness over a year's time. In 2009, 334 communities-representing 2,988 counties and 1,056 cities-reported usable HMIS data to the report, a sizable increase from last year's report ( 222 communities). At the same time, the point-in-time (PIT) counts essential for estimating the numbers and characteristics of all homeless people, both sheltered and unsheltered, are improving as communities use more rigorous methodologies for conducting the counts.

For the first time, this 2009 AHAR includes information from in-person interviews with local service providers located in nine communities nationwide. This qualitative information provides a contextual backdrop for understanding how homelessness is changing.

## Point-in-Time Estimates of Homeless People

On a single night in January 2009, there were an estimated 643,067 sheltered and unsheltered homeless people nationwide. More than 6 in 10 people who were homeless at a single point-in-time were in emergency shelters or transitional housing programs, while 37 percent were unsheltered on the "street" or in other places not meant for human habitation. The total number of people homeless on a single night has remained fairly stable from year to year, but over time a smaller share of all homeless people is unsheltered, and a larger share is
found in emergency shelters or transitional housing. This may in part reflect better "street counts," but it probably also reflects community success in getting people off the streets and into shelters or housing.

## Data Sources Used in the AHAR

The AHAR is based on two data sources:

1. Continuum of Care applications are submitted to HUD annually as part of the competitive funding process and provide one-night, Point-in-Time (PIT) counts of both sheltered and unsheltered homeless populations. The PIT counts are based on the number of homeless persons on a single night during the last week in January, and the most recent PIT counts for which data are available nationally were conducted in January 2009.
2. Homeless Management Information System (HMIS) are electronic administrative databases that are designed to record and store client-level information on the characteristics and service needs of homeless persons. HMIS data is used to produce counts of the sheltered homeless population over a full year-that is, people who used emergency shelter or transitional housing programs at some time during the course of a year. The 2009 AHAR uses HMIS data for the most recent, one-year reporting period and compares these data to previous HMIS-based findings.

Nearly two thirds of the people homeless on a single night were homeless as individuals (63 percent), while more than a third ( 37 percent) were homeless as part of a family. Family members were much less likely than individuals to be unsheltered. Only 21 percent of all homeless family members were unsheltered on the night of the point-in-time count, while almost half of homeless individuals were unsheltered.

Information from CoC applications includes counts of particular homeless subpopulations, including people whose homelessness is chronic-that is, individuals with disabilities and long or frequent patterns of homelessness. National policy has focused on ending chronic homelessness through funding incentives to develop permanent supportive housing and through the dissemination of best practice strategies for reducing chronic homelessness. The January 2009 PIT estimate of chronic homelessness is 110,917 people, more than a 10 percent drop from the PIT count of 124,135 chronically homeless people in 2008. All of the decrease occurred among unsheltered chronically homeless people. While measuring the scope of chronic homelessness remains challenging, a majority of CoCs ( 53 percent) reported a decrease in chronic homelessness between 2008 and 2009.

Homelessness is heavily concentrated in large coastal states, with California, New York, and Florida accounting for 39 percent of the PIT count in 2009. On a single night in January 2009, the states with the highest concentrations of homeless people were Nevada, where .85 percent of the total population was homeless, followed by Oregon, Hawaii, California, and

Washington. Kansas, South Dakota, and West Virginia had the nation's lowest concentrations of homeless persons.

## One-Year Estimates of Sheltered Homeless People

Nearly 1.56 million people used an emergency shelter or a transitional housing program during the 12-month period (October 1, 2008 through September 30, 2009). Two thirds were homeless as individuals, and one-third were homeless as members of families.

For the second straight year, the number of sheltered homeless families increased, while the number of sheltered homeless individuals dropped. In 2009, approximately 1,035,000 individuals used sheltered or transitional housing at some time during the year, as did 535,000 people who were there as part of a family. A family is a household that includes an adult 18 years of age or older and at least one child. All other sheltered homeless people are considered individuals. Considered as households rather than separate people, slightly more than 170,000 families were sheltered homeless in 2009, about a 30 percent increase since 2007.

## Sheltered Homeless People in 2009

A typical sheltered homeless person in 2009 was an adult male, a member of a minority group, middle-aged, and alone. Men are overrepresented in the sheltered homeless population--63.7 percent of homeless adults are men, compared to 40.5 percent of adults in poverty. African Americans make up 38.7 percent of the sheltered homeless population, about 1.5 times their share of the poverty population. Only 2.8 percent of the sheltered homeless population is 62 years old or older. Homeless people have higher rates of disability than either the poverty population or the total U.S. population; slightly over two-thirds of sheltered homeless adults have a disability, according to HMIS data.

People who are homeless by themselves are very different from those who are homeless with children. Sheltered individuals are overwhelmingly male. More than three quarters are over 30 , more than 10 percent are veterans, and more than 40 percent have a disability. In contrast, adults in sheltered homeless families are overwhelmingly female, most are under age 31 , and very few are veterans or have a disability. Three-fifths of the people in homeless families are children, and more than half of the children are under age 6 .

The geographic distribution of homelessness is markedly different from the distribution of the nation's poverty and total populations. The share of sheltered homeless people in principal cities in 2009 is nearly twice the share of the poverty population in these areas, 68.2 vs. 35.6 percent. Homeless individuals are particularly likely to be in urban areas. Nearly three-quarters of all sheltered individuals ( 72.2 percent) accessed a homeless residential program in a principal city, compared with 61.2 percent of persons in families.

Almost two-fifths of people entering an emergency shelter or transitional housing program during 2009 came from another homeless situation. Among those already homeless, almost two thirds were in shelter rather than in a place not intended for human habitation.

Another two-fifths of people who entered shelter in 2009 came from a housed situation (in their own or someone else's home), and the remaining one-fifth were split between institutional settings or other situations such as hotels or motels. Families were particularly likely to be housed the night before becoming homeless: more than 6 in 10 were either in their own housing unit ( 20 percent), staying with family ( 29 percent), or staying with friends (14 percent).

More than three quarters of sheltered homeless people in 2009 used only emergency shelter, 77 percent. Families were more likely than individuals to use transitional housing either alone or in combination with emergency shelter, 30 vs. 19 percent. Most people had relatively short lengths of stay in emergency shelters: the median length of stay was 17 days for individuals and 36 days for persons in families.

## Trends in Sheltered Homelessness, 2007-2009

The overall number of sheltered homeless people increased slightly between 2007 and 2008 before dropping slightly-by about 2 percent or 35,000 people-between 2008 and 2009. The continued rise in family homelessness across the three years, from 131,000 families in 2007 to 170,000 families in 2009 , is almost certainly related to the recession. However, the increase was more pronounced between 2007 and 2008, even through unemployment rates remained high during the 2009 reporting period (October 2008 through September 2009). It may be that many families already at risk of becoming homeless lacked sufficient support networks and became homeless almost immediately after the economy turned down. A much larger group turned to family and friends and may be doubled up and still at great risk of becoming homeless. The percentage of adults in families who reported that they had been staying with families before entering shelter increased steadily over the three-year period, from 24.2 percent in 2007 to 29.4 percent in 2009, as did the total percentage reporting that they had been in some sort of "housed" situation before becoming homeless, reaching 62.5 percent in 2009.

All of the increase in family homelessness in 2009 compared with 2008 was in the use of emergency shelter by family members, rather than transitional housing. Families stayed longer in shelters in 2009 than in 2008, with the median number of nights rising from 30 to 36 . Not only did family homelessness continue to increase between 2008 and 2009, it also seems to have become more severe in the sense that it took the typical family longer to leave shelter.

More individuals—adults entering shelter by themselves-reported that their previous living situation was a place not meant for human habitation in 2009 compared with 2008. This may suggest that communities are having some success in getting people off the "street" and into
shelter or other forms of housing, especially since the overall number of unsheltered homeless individuals reported by communities in the PIT count did not go up.

Few changes occurred in the demographic characteristics of sheltered homeless people. A slight aging of the adult homeless population (more people over 50) is consistent with other research that points to the aging of a cohort of people who became susceptible to homelessness when they were younger. Both families and individuals identifying themselves as African American have dropped steadily, from a high starting point. Adults in sheltered homeless families were more likely in 2009 to be men ( 20.4 percent) than they were in 2007 (18.0 percent). This likely reflects the pressures of the recession and is consistent with reports from the in-person interviews with providers conducted for this report.

## The Nationwide Capacity of Residential Programs for Homeless People

In their annual applications to HUD, CoCs submit information on their inventories of residential beds for homeless people. In 2009 , CoCs reported a total of 643,423 year-round beds nationwide in 20,065 separate emergency shelter, transitional housing, permanent supportive housing, and safe haven programs.

For several years, one of HUD's policy priorities has been the development of permanent supportive housing programs that provide a combination of housing and supportive services to people who were formerly homeless and with disabilities. In 2009 for the first time, the number of beds in permanent supportive housing surpassed the numbers of beds in emergency shelter or transitional housing. Permanent supportive housing increased by almost 60,000 beds between 2006 and 2009. More than half the growth was in the last year, from just under 196,000 beds in 2008 to more than 219,000 in 2009.

Although there may be other factors that contributed to the decline in unsheltered homelessness and chronic homelessness in the PIT counts-including improved enumeration strategies-we believe the reported reductions reflect this increase in permanent supportive housing.

## Looking Ahead

The 2010 AHAR will continue to provide Congress and the nation with updated counts of homelessness nationwide, including counts of individuals, persons in families, and special population groups such as chronically homeless people and persons with disabilities. These topics will be explored using data from an ever-expanding group of communities that participate in the AHAR, which now includes the majority of Continuums of Care nationwide. The 2010 AHAR also will add another full-year of HMIS data to further highlight trends in homelessness and identify any long-term impacts of the economic recession.

The 2010 AHAR will be the first to include data on people served in permanent supportive housing programs, in addition to the data from emergency shelter and transitional housing programs that have constituted the first five AHARs. The slight decrease in the number of people using transitional housing programs in 2009 may have been a result of communities moving families directly from emergency shelters to permanent supportive housing. The 2010 AHAR will be able to assess this question, among many others, in a more nuanced fashion. The 2010 AHAR will also be the first to examine trends in homelessness among veterans, comparing the 2009 supplemental report on homeless veterans (to be released later in 2010) with the 2010 supplemental report.

HUD continues to view the AHAR as the primary resource for up-to-date information about homelessness based on locally-derived HMIS data and is exploring ways to make these data readily accessible to states, localities, and the general public. Based on the AHAR, policymakers and practitioners alike will be able to better understand homelessness in their communities, allocate local homeless assistance funds effectively, improve program operations, and work toward the ultimate goal of ending homelessness.

## Chapter 1 Introduction

This report is the fifth Annual Homeless Assessment Report (AHAR) on homelessness in the United States. The report provides estimates of the prevalence of homelessness nationwide, the demographic characteristics of homeless people, and the way homeless people use the residential services system. The estimates include the most recent counts of homeless individuals, persons in families, and special population groups such as veterans and persons experiencing chronic homelessness. The report also covers the types of locations where people use emergency shelter and transitional housing; where people were just before they entered a residential program; how much time they spent in shelters over the course of a year; and the size and use of the U.S inventory of residential programs for homeless people.

This report builds on last year's report by adding data on sheltered homeless people for another full year, allowing for a comparative analysis of homelessness that spans three years-2007, 2008, and 2009. The inclusion of data for a third year is important because it marks the establishment of discernable trends in homelessness. This report is also the first to include information from in-person interviews with local service providers located in nine communities nationwide. ${ }^{1}$ The qualitative information provides a contextual backdrop for understanding how homelessness is changing throughout the nation. Finally, the report adds Point-in-Time (PIT) counts of sheltered and unsheltered persons and of homeless subpopulations for another year, providing trend data for 2006 through 2009.

The trend information reported in the AHAR is useful for several reasons. Trend information can help federal, state and local policymakers understand whether the nation's policy responses are making a difference. They also show how the portrait of homelessness is changing over time, which may suggest a need to provide additional assistance to particular homeless subpopulations. Finally, trend information on the use of the nation's homeless residential system may suggest the need reallocate funds to support programs that are in high demand.

### 1.1 History of the AHAR

At the direction of Congress, the U.S. Department of Housing and Urban Development (HUD) initiated a process to collect and analyze data on homelessness nationwide. HUD created uniform, national data definitions for local Homeless Management Information Systems (HMIS), which are designed primarily to be case management tools for local service providers

[^0]and communities. HMIS are maintained by localities, and the geographic coverage of HMIS systems varies considerably. Some systems cover just a city, others a city together with the rest of a metropolitan area. Still others are statewide or cover several counties in a state.. HUD instructed programs receiving HUD McKinney-Vento funding to report to the HMIS and encouraged all programs for homeless people-regardless of their funding source-to report as well. HMIS implementations have grown stronger over the past several years, and participation among local providers in these systems is rising. Currently, about 68 percent of all beds that are available for homeless and formerly homeless people are included in HMIS. ${ }^{2}$

In concert with the implementation and support of HMIS, HUD established a nationally representative sample of communities and began working with them to produce unduplicated estimates of the sheltered homeless population (i.e., people in emergency shelters and transitional housing). ${ }^{3}$ These estimates were supplemented by data from additional communities willing to provide their HMIS data. Since 2005, sample communities and others have been submitting unduplicated counts of shelter users, as well as other information about their demographic characteristics and patterns of service use for analysis and reporting in the AHAR.

Five reports have been submitted to Congress since HUD launched this effort:

- The 2005 AHAR covered a three-month period in 2005 and was based on HMIS data reported by 63 communities.
- The 2006 AHAR covered six months, January through June 2006, and included information from 74 communities.
- The 2007 AHAR was the first report to cover an entire year, October 2006-September 2007, and serves as the baseline for analyzing trends over time. For this report, 98 communities provided useable data.
- The 2008 AHAR covered the next 12-month period, October 2007 through September 2008, and used HMIS data from 222 communities.
- This report, or the 2009 AHAR, covers the October 2008 to September 2009 period and includes data from 334 communities- representing 2,988 counties and 1,056 cities. ${ }^{4}$ The report is based on 570,335 person records that were aggregated and reported to the AHAR.

[^1]HUD also requires CoCs to report point-in-time (PIT) data collected for a single night in January as part of their annual applications for McKinney-Vento funding. The PIT data provide a one-night "snapshot" of homelessness within each CoC, including both the sheltered and unsheltered homeless populations. For several years, HUD has provided extensive technical assistance to communities on how to conduct these PIT counts and, as a result, the reliability of PIT data has improved greatly over time. The CoC applications also provide information on the inventory of residential programs, beds, and units for homeless and formerly homeless people.

## Definitions of Key Terms

1. Homeless Management Information System (HMIS): HMIS is a software application designed to record and store client-level information on the characteristics and service needs of homeless persons.
2. Individuals: The HMIS-based estimates of sheltered homeless individuals include single adults, unaccompanied youth, persons in multi-adult households, and persons in multi-child households. A multi-adult household is a household composed of adults only-no children are present. A multi-child household is composed of children only (e.g., parenting youth)-no adults are present.
3. One-Year Sheltered Counts: 12-month counts of homeless persons who use an emergency shelter or transitional housing program at any time from October though September of the following year. The one-year counts are derived from communities' administrative databases, or Homeless Management Information Systems (HMIS).
4. Persons in Families: The HMIS-based estimates of homeless persons in families include persons in households with at least one adult and one child.
5. Point-in-Time (PIT) Counts: One-night counts of both sheltered and unsheltered homeless populations. The one-night counts are reported on CoC applications and reflect a single-night during the last week in January.
6. Principal City: Following guidance from the U.S. Office of Management and Budget, the AHAR replaces the term "central city" with "principal city." The largest city in each metropolitan or micropolitan statistical area is designated a principal city, and other cities may qualify if specified requirements (population size and employment) are met.
7. Sheltered: A homeless person who is in an emergency shelter or transitional housing program for homeless persons.
8. Unsheltered: A homeless person who is living in a place not meant for human habitation, such as the streets, abandoned buildings, vehicles, parks, and train stations.

### 1.2 AHAR Estimates for 2009

The AHAR provides two types of estimates. Estimates that are based on CoC PIT data provide one-night counts of all people who are homeless either in shelters or in places not meant for human habitation (colloquially, "the street"). Estimates that are based on HMIS data provide counts of all people who are sheltered homeless at any time during a year. Both types of estimates are important:

- The PIT data provide a total count of all homeless people on a single night in January and describe the share of people who are sheltered (i.e., in emergency shelter or transitional housing) or unsheltered (i.e., in a place not meant for human habitation) on that night.
- The HMIS data provide longitudinal counts of shelter use over a 12 -month period, offer a more detailed demographic profile of sheltered homeless people, and described their use of the residential services system.

At this time, neither PIT nor HMIS-based data support an unduplicated estimate of the total number of people who are sheltered and unsheltered homeless over the course of a year. ${ }^{5}$ However, given the information provided in this report, we can estimate that roughly 2 million people were homeless-sheltered and unsheltered-at some time during 2009.

### 1.3 This Report

Chapter 2 provides more detail on the counts of homeless persons. The counts reported in chapter 2 include both the PIT estimates of people who are in shelters and on the streets and the HMIS-based estimates of people who access a shelter at some time during 2009. The counts are presented separately for people who are homeless as individuals and those who are part of a family. The chapter describes trends in the PIT estimates over a four-year period, 2006-2009, and also provides detail on how homelessness varies from state to state.

Chapter 3 describes the sheltered homeless population in 2009. The chapter focuses on the demographic characteristics of sheltered homeless people and compares this profile to the characteristics of people living in poverty and the total U.S. population. The chapter also discusses the types of locations where people use residential programs for homeless people and how they use programs-for example, do they use emergency shelter or transitional housing programs and how long do they stay?.

Chapter 4 focuses on trends in sheltered homelessness between 2007 and 2009. The chapter describes shifts in the homeless population between individuals and families, the changing geography of homelessness, and changes in the use of the residential system for homeless people. The chapter also reports changes in the patterns of becoming homelessthat is, where people said they were the night before entering an emergency shelter or a transitional housing program and how long they had been there.

[^2]Chapter 5 documents the numbers and locations of residential programs for homeless people, including permanent supportive housing, as well and emergency shelters and transitional housing programs. The chapter also reports how intensively emergency shelters and transitional housing programs are used and how that has changed over time.

Appendix A provides a list of the communities providing useable data to this 2009 AHAR. Appendix B describes the methodology for selecting the nationally representative sample of communities, collecting and cleaning the data, and for weighting and adjusting the data to create the national estimates. Appendix C presents the PIT estimates for each state and CoC. Appendix D consists of detailed tables based on the HMIS data. The tables provide counts of sheltered homeless people in numerous categories for 2009 and are intended to supplement the information provided in the body of the report. Tables for 2007 and 2008 may be found in the appendices to those AHAR reports.

### 1.4 Trends in Homelessness and the Economic Crisis

This report captures information on the use of the homeless residential system during the height of the economic and foreclosure crisis, which began in December 2007. The threeyear changes documented in this report provide some evidence of how the recession has affected homelessness in America.

The one-year estimates of shelter use show that almost 62,000 more family members were in shelter at some point during 2009 than had been during 2007, making up almost 40,000 families. The continued growth in sheltered family homelessness almost certainly reflects the ongoing effect of the recession. When compared to 2008, a slightly higher proportion of families came from housed situations, most commonly staying with family. The fragile economic circumstances of the relatives of struggling parents may mean that, as soon as job losses begin in an economic downturn, support networks for families at risk of homelessness fall apart. Doubled-up housing situations cannot be sustained, cash is no longer available to help others with rent payments, and families turn to homeless shelters as the only way of keeping a roof over their heads.

The data also show that adults in families were somewhat more likely to be men in 2009 than they were in 2007. Because of the recession, more families with two adults may have become homeless, as well as more families with only a father present. Local service providers in six of the nine communities visited for this report said they had seen an increase in two-parent families and male-headed families. Providers attribute the increase in twoparent families to the effects of the recession, which is making it difficult for even one parent to find a job.

Looking ahead, the long-term impacts of the recession are unclear. A recent study found that the recession has caused a dramatic increase, almost five-fold, in the rate of overcrowding, suggesting that many families are doubling up in response to the economic downturn. ${ }^{6}$ If some of these family support networks already are struggling to make ends meet, some of the doubled-up families may find their way into the homeless residential service system during 2010. On the other hand, as the nation comes out of the recession and as the stimulus funding made available through the Homelessness Prevention and Re-housing Program (HPRP) starts helping families in crisis avoid shelter, it also is possible that family homelessness will decline during the next reporting period. Indeed, as of May 2010, HPRP has already served more than 300,000 people and approximately 75 percent of the funds have been used for prevention services.

[^3]
## Chapter 2

## National Estimates of All Homeless People, Sheltered and Unsheltered

This chapter provides the 2009 national estimates of the prevalence of homelessness on a single night and during a 12-month period (October 2008 to September 2009). Using point-in-time (PIT) and HMIS data reported by Continuums of Care, this chapter:

- Presents the PIT counts of all sheltered and unsheltered homeless people, distinguishing between sheltered and unsheltered homeless people and between people who are homeless as individuals and as members of families. The chapter also describes how these estimates changed between 2006 and 2009 and describes which states have disproportionate numbers of homeless people compared with the state's overall population.
- Presents the PIT counts of homeless "subpopulations," including people who are chronically homeless; people with severe mental illness; people with substance abuse issues; veterans; unaccompanied youth; and people living with HIV/AIDS.
- Presents the one-year estimates of sheltered homeless people based on HMIS data. This chapter summarizes the estimates for 2009 and prior years that are discussed in more detail in Chapters 3 and 4.

### 2.1 One-Day Count of Homeless People

On a single night in January 2009, all Continuums of Care across the country were required to conduct a thorough enumeration of the homeless. ${ }^{7}$ In total, the 452 CoCs found 643,067 people who were literally homeless on the night of the count. Sixty-three percent of those counted were sheltered-sleeping in emergency shelters or transitional housing-while the other 37 percent were unsheltered-sleeping on the streets, in their cars, in abandoned buildings, or in other places not meant for human habitation. Nearly two-thirds (63 percent) of

| On a single night in |
| :---: |
| January 2009, there |
| were 643,000 homeless |
| people in shelters or on |
| the streets. | people who were homeless on the night of the PIT count were individuals. Although the PIT count was conducted in the middle of winter, nearly half of all homeless individuals were unsheltered. Persons in families-households

[^4]with at least one adult and one child-accounted for 37 percent of those homeless on the night of the PIT count. Less than a quarter of homeless persons in families were unsheltered.

The results of the 2009 PIT count confirm that homelessness is still a serious problem that affects far too many people. However, the percentage of all people in the U.S. who are literally homeless on any night is very small. On the night of the January 2009 PIT count roughly one in every 500 people and one in every 75 people living below the poverty line was literally homeless. This suggests that the long-stated goal of eliminating homelessness could be achieve with adequate and effectively targeted resources.

| Exhibit 2-1: Homeless Persons and Households by Sheltered Status, Single Night <br> in 2009 |  |  |

### 2.2 Trends in PIT Counts of Homeless People

Exhibit 2-2 shows the change in the PIT count of all homeless people between January 2008 and January 2009. The top panel of the exhibit includes all 452 CoCs that submitted data in 2009, while the bottom panel excludes 3 CoCs that experienced important methodological issues in either 2008 or 2009 that merit special attention. The top panel shows a 3.2 percent decrease in the total PIT count of all homeless people from January 2008 to January 2009, from 664,414 to 643,067 . The decline includes 2.5 percent decrease in the number of homeless individuals and a 4.5 percent decrease in the number of homeless persons in families. The exhibit also shows a 4.3 percent increase in the number of sheltered homeless people that was offset by a 13.7 percent decline in the number of people who were unsheltered.

The decline in homelessness in 2009 was driven primarily by a single city with a large homeless population, the City of Los Angeles. Between 2007 and 2009, the total count of homeless people on a single night in Los Angeles decreased from 68,608 to 42,694, and the city's unsheltered homeless count decreased by almost half from 57,166 to 28,644. ${ }^{8}$ In addition to Los Angeles, two other cities experienced significant methodological issues with their annual PIT count of homeless people-New Orleans and Detroit. ${ }^{9}$ Removing these three cities from both the 2008 and 2009 counts reveals a much different trend-the count of sheltered and unsheltered people on a single night in January 2008 and 2009 increases by 2.1 percent. The increase in homelessness includes a 4.1 percent increase in sheltered homelessness and a 1.7 percent decrease in unsheltered homelessness. The removal of these large cities from the PIT counts and the resulting shift in trends illustrates the need to interpret changes in one-night PIT counts carefully. Unlike HMIS-based counts (presented in chapters 3 and 4), one-night PIT counts are particularly sensitive to dramatic changes within the nation's largest cities and to evolving enumeration strategies.

[^5]Exhibit 2-2: Changes in PIT Counts of Homeless People by Sheltered Status and Household Type, 2008-2009

|  | 2008 Count | 2009 Count | Percent Change 2008-2009 |
| :---: | :---: | :---: | :---: |
| All Continuums of Care |  |  |  |
| Sheltered Status |  |  |  |
| Sheltered | 386,361 | 403,308 | +4.3\% |
| Unsheltered | 278,053 | 239,759 | -13.7\% |
| Household Type |  |  |  |
| Individuals | 415,202 | 404,957 | -2.5\% |
| Persons in Families | 249,212 | 238,110 | -4.5\% |
| Total | 664,414 | 643,067 | -3.2\% |
| Excluding Three Continuums of Care ${ }^{\text {a }}$ |  |  |  |
| Sheltered Status |  |  |  |
| Sheltered | 369,191 | 384,486 | +4.1\% |
| Unsheltered | 206,934 | 203,468 | -1.7\% |
| Household Type |  |  |  |
| Individuals | 350,523 | 356,222 | +1.6\% |
| Persons in Families | 225,602 | 231,732 | +2.7\% |
| Total | 576,125 | 587,954 | +2.1\% |

${ }^{\text {a }} \quad$ The three CoCs are The City of Los Angles CoC, the City of Detroit CoC and the City of New Orleans CoC. These CoCs were excluded from the analysis because there were significant methodological issues related to their 2008 or 2009 PIT count of homeless persons.

Source: 2009 Continuum of Care Applications: Exhibit 1, CoC Point-in-Time Homeless Population and Subpopulations Charts excluding Los Angeles, Detroit, and New Orleans data from both 2008 and 2009.

Exhibit 2-3 shows a gradual decline from 2006 to 2009 in the number of individuals and persons in families who were homeless on the night of the annual PIT count. The largest decline occurred between 2006 and 2007 and the counts have been fairly stable since then. While the decline is welcome news, particularly given overall changes to the economy and the housing market, it is difficult to disentangle the effects of successful policy interventions from nationwide improvements in PIT enumeration methods that have lead to greater accuracy.

Source: 2006 through 2009 Continuum of Care Application: Exhibit 1, CoC Point-in-Time Homeless
Population and Subpopulations Charts

In addition, these national trends mask some of the changes that occurred within CoCs. As shown in Exhibit 2-4, one-third of CoCs reported an increase in both individual and family homelessness, one-quarter reported a decrease in both categories, and the remainder reported an increase in one category and a decrease in the other. A majority of CoCs reported an increase in sheltered homelessness ( 58 percent) but a decrease in unsheltered homelessness ( 53 percent) (see Exhibit 2-5). The increase in the proportion of sheltered homeless people could suggest that communities are successfully moving people off of the streets and into shelter or other forms of housing. HMIS data (reported in Chapter 4) also show that more individuals report sleeping in a place not suitable for human habitation before entering shelter.

Exhibit 2-5 also shows considerable fluctuations in the magnitude of change in CoC's PIT counts of homeless people. Forty percent of CoCs reported an increase or decrease of 50 percent or more in their unsheltered count, and only 14 percent reported such large changes in their sheltered counts. Unsheltered counts are more prone to large shifts from one year to the next for several reasons. First, shelters have capacity constraints that limit how many people they can serve on any night. Unless CoCs change their capacity by adding or reducing shelter beds, their sheltered counts can fluctuate only within a limited range. In contrast, there is no fixed limit on how many people can be living in unsheltered conditions at any time. Also, conducting a count of sheltered people can be relatively straightforward

Exhibit 2.4 Change in Homelessness Among CoCs, 2008-2009

## CoCs Reporting:

- Increase in family and individual homelessness
$\square$ Increase in families; decrease in individuals
$\square$ Increase in individuals; decrease in families
ㅁ Decrease in both individual and family homelessness
while conducting accurate counts of unsheltered people can be very challenging. Street count methodologies differ greatly by CoC and year, and even marginal changes to these methodologies can result in substantial impacts on the counts. Finally, inclement weather conditions can hamper CoCs abilities to conduct thorough street counts on any given year, and thus lead to considerable changes in their counts of unsheltered homeless persons.

For the 2009 PIT count, HUD contacted any CoC that reported either a greater than 100 percent increase or a greater than 50 percent decrease in its unsheltered homeless count between 2008 and 2009. Of the 79 CoCs contacted, 41 (or 52 percent) attributed the change to a change in their methodology, 23 (or 29 percent) to a change in the weather, and 15 (or 19 percent) believed the change was an accurate reflection of the number of unsheltered homeless people in their CoC. These results highlight the need for caution when attempting to attribute changes in the data to larger policy or economic factors.

### 2.3 Where People were Homeless on the Night of the PIT Count

Exhibit 2-6 shows the percentage of the homeless and total U.S. population within each census region. Compared to their portion of the total population, people in the West are over-represented within the homeless population and people in the Midwest and South are under-represented. Between 2008 and 2009 the number of homeless people stayed the same in the Northeast, decreased in the Midwest and West, and increased in the South.

| Exhibit 2-6: PIT Count of Homeless People by Census <br> Region, 2009 |  |  |
| :--- | :---: | :---: |
|  | Percent of Homeless <br> Population | Percent of Total U.S. <br> Population |
| Northeast | $18 \%$ | $18 \%$ |
| Midwest | $12 \%$ | $22 \%$ |
| South | $32 \%$ | $37 \%$ |
| West | $37 \%$ | $23 \%$ |

Source: 2009 Continuum of Care Application: Exhibit 1, CoC Point-in-Time Homeless Population and Subpopulations Chart. Total population count comes from 20062008 weighted averages from the American Community Survey.

Appendix C provides the results of the 2009 homeless PIT counts for each state. The data show that, while homelessness occurs everywhere throughout the United States, it is particularly concentrated in large coastal states. Thirty-nine percent of people counted as homeless on the night
of the PIT count were located in California, New York, or Florida. These three states account for 25 percent of the total U.S. population. The disproportionate presence of homelessness in these states could be because of high housing costs in these states.

States that have large shares of homeless people when compared to their total state populations include some smaller states as well (see Exhibit 2-7). Excluding Washington, DC, which is not a state, Nevada has the highest number of homeless people per capita, followed by Oregon, Hawaii, California, and Washington State. All of these states are located in the West and, as discussed in chapter 5, have the largest bed per capita rates in the nation. Their high percentages of homeless people could reflect a high percentage of total population found in principal cities (Nevada), high housing costs (California and Hawaii), or a high percentage of adult men without family attachments (Oregon and Washington) Kansas, South Dakota, and West Virginia had the lowest reported rates of homelessness.

Exhibit 2-7: Percentage of National Homeless Population by State

### 2.4 PIT Counts of Homeless Subpopulations

The PIT data also provide information on the number of homeless people who are in particular subpopulations. CoCs are required to collect information on the number of chronically homeless people (for both sheltered and unsheltered locations) and on other subpopulations, such as veterans and people with severe mental illness (for sheltered conditions only).

## Chronic Homelessness

The 2009 PIT count identified 110,917 individuals who met the definition of chronic homelessness. ${ }^{10}$ The majority of chronically homeless individuals ( 58 percent) were unsheltered. Overall, 27 percent of all homeless individuals, 21 percent of sheltered homeless individuals, and 35 percent of unsheltered homeless individuals experienced chronic homelessness.

[^6]

Source: 2006 through 2009 Continuum of Care Applications: Exhibit 1, CoC Point-in-Time Homeless Population and Subpopulations Charts

As shown in Exhibit 2-8, the number of chronically homeless individuals decreased by 10.6 percent from 2008 to 2009 , from 124,135 to 110,917 . The number of sheltered chronically homeless individuals stayed the same, while the number of unsheltered homeless individuals decreased. As in the overall PIT counts, the majority of the decline in chronic homelessness occurred within the City of Los Angeles. Excluding the City of Los Angeles from both the 2008 and 2009 counts, there was a 1.1 percent decline in chronic homelessness.

A slight majority of CoCs (53 percent) reported a decrease in chronic homelessness between 2008 and 2009 (see Exhibit 2-9). As the exhibit suggests, only 13 percent of CoCs reported a 50 percent or greater decline in chronic homelessness, but this small proportion of CoCs accounted for more than 23,000 fewer chronically homeless people between 2008 and 2009.

Source: 2008 and 2009 Continuum of Care Applications: Exhibit 1, CoC Point-in-Time Homeless Population and Subpopulations Charts

## Other Subpopulations

CoCs were also asked to report on the number of sheltered homeless people on a single night in January who are veterans, have severe mental illness, chronic substance abuse problems, HIV/AIDS, are victims of domestic violence, or who are unaccompanied youth (see Exhibit 2-10). ${ }^{11}$ Based on these PIT estimates, one-third of sheltered homeless persons were reported to have a chronic substance abuse problem and one-quarter reportedly had a severe mental illness on a single night in January 2009. Thus, a large percentage of the homeless population has issues that go beyond a temporary housing crisis, and supportive services maybe needed to address those issues. However, contrary to the perceptions that some people have of homelessness, a majority of homeless shelter users do not have chronic substance abuse problems or severe mental illness.

Thirteen percent of sheltered homeless adults were veterans, a lower percentage than has been reported elsewhere. There are several possible explanations for this discrepancy. First, the PIT data on veteran status are only for sheltered homeless people, and homeless veterans may be more likely to be unsheltered than other homeless people. If so, the percentage of sheltered homeless people who are veterans would be lower than the percentage of all homeless people who are veterans. Second, in some areas of the country, residential programs for the homeless that are funded through the U.S. Department of Veterans Affairs do not report data to the CoC. Finally, there is anecdotal evidence that homeless veterans sometimes do not divulge their veteran status to homeless program staff.

Victims of domestic violence constituted twelve percent of the sheltered homeless population, four percent had HIV/AIDS, and only one percent consisted of unaccompanied people less than 18 years of age.

The percent of the sheltered population with any of these characteristics or experiences in January 2009 was lower than it was in January 2008 or in January 2006. The reasons for the

[^7]decrease are difficult to pinpoint. One possible factor is the development of permanent supportive housing specifically targeted to certain subpopulations (HIV/AIDS, veterans, chronic substance abusers, people with severe mental illness). Second, improvements in methodology may have contributed to the decline, as CoCs have stopped including substance abuse programs, orphanages, or other programs with residents who should not be considered homeless in their PIT counts. Finally, the recession may be causing an increase in the number of people who are homeless for purely economic reasons.

Source: 2006-2009 Continuum of Care Applications: Exhibit 1, CoC Point-in-Time Homeless Population and Subpopulations Charts

### 2.5 Estimates of Sheltered Homeless Individuals and Families during a One-Year Period

This section shifts from information based on CoC PIT data to longitudinal estimates of the number of people using emergency shelters and transitional housing at any time during the one-year period from October 1, 2008 to September 30, 2009. These estimates are based on CoCs' HMIS data. Unlike the PIT counts, CoCs are not required to participate in the AHAR, and thus some CoCs do not submit HMIS data to HUD. Participation in the AHAR is growing immensely, from 222 communities in 2008 to 334 communities in 2009, spurred by the inclusion of AHAR-related questions in the CoC competitive scoring process for McKinney-Vento funds. Altogether, the 334 communities that participated in the 2009 AHAR submitted usable data on 570,335 person records. These data were statistically
adjusted to produce the national estimates that are summarized here and presented in more detail in Chapters 3 and $4 .{ }^{12}$

Roughly 1.56 million people, or one in every 200 Americans, spent at least one night in an emergency shelter or transitional housing program in 2009. Two-thirds of sheltered persons were individuals and one-third were persons in families. The total number of homeless shelter users declined by nearly 30,000 people from 2008 to 2009 . However, for the second straight year the number of homeless families increased: 473,541 in 2007; 516,724 in 2008; and 535,447 in 2009. Overall, family homelessness increased by about 7 percent between 2008 and 2009 and 30 percent from 2007 to 2009. As a result of this increase, along with the drop in the number of individual homeless people, the percentage of sheltered homeless people who were homeless as part of families rather than by themselves increased from 29.8 percent in 2007 to 34.1 percent in 2009.

Exhibit 2-11: Estimates of Sheltered Homeless Individuals and Persons in Families During a One-Year Period, 2007-2009

|  | 2007 |  | 2008 |  | 2009 |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total Number | \% of Sheltered Homeless Population | Total Number | \% of Sheltered Homeless Population | Total Number | \% of Sheltered Homeless Population |
| Total Number of | 1,588,595 ${ }^{\text {c }}$ |  | 1,593,794 ${ }^{\text {c }}$ |  | 1,558,917 ${ }^{\text {c }}$ |  |
| Individuals ${ }^{\text {b }}$ <br> Persons in families | $\begin{aligned} & 1,115,054 \\ & 473,541^{d} \end{aligned}$ | $\begin{aligned} & 70.2 \% \\ & 29.8 \% \end{aligned}$ | $\begin{aligned} & 1,092,612 \\ & 516,724^{\mathrm{d}} \end{aligned}$ | $\begin{aligned} & 67.9 \% \\ & 3.1 \% \end{aligned}$ | $\begin{aligned} & 1,034,659 \\ & 535,447^{\mathrm{d}} \end{aligned}$ | $\begin{aligned} & 65.9 \% \\ & 34.1 \% \end{aligned}$ |
| Number of Sheltered Households with Children | 130,968 ${ }^{\text {d }}$ | - | $159,142^{\text {d }}$ | - | 170,129 ${ }^{\text {d }}$ | - |

${ }^{\text {a }}$ These estimated totals reflect the number of homeless persons in the 50 states and the District of Columbia who used emergency shelters or transitional housing programs during the one-year period from October 1 through September 30 of the following year. The estimates do not cover the U.S. Territories and Puerto Rico and do not include persons served by "victim service providers." The estimated totals include an extrapolation adjustment to account for people who use emergency shelters and transitional housing programs but whose jurisdictions do not yet participate in their respective HMIS. However, a homeless person who does not use an emergency shelter or transitional housing during the 12 -month period is not included in this estimate. Percentages may not sum to 100 percent due to rounding.
b This category includes unaccompanied adults and youth as well as multi-adult households without children.
c This estimate includes unaccompanied individuals and persons in households. In 2007, the 95 percent confidence interval for the estimated number of sheltered homeless persons in the population was $1,043,775$ to $2,133,415$ persons (or $+/-544,820$ persons). In 2008, the 95 percent confidence interval is $1,180,758$ to $2,006,830$ (or $+/-413,036$ persons). In 2009 , the 95 percent confidence interval is $1,265,075$ to $1,922,513$ (or $+/-328,719$ ).
d In 2007-2009, approximately 1 percent of homeless persons were served both as an unaccompanied individual and a person in a family. In this exhibit, such people appear in both categories in 2008, so the total number of sheltered persons is slightly less than the sum of individuals and families.
Source: Homeless Management Information System data, 2007-2009

[^8]Chapter 3 provides information on the characteristics of people who used emergency shelter and transitional in 2009, and Chapter 4 provides detailed information on the trends in sheltered homelessness across the three years from 2007 to 2009.

### 2.6 Summary of the National Estimates of All Homeless People

Results from the single-night PIT count:

- On a single night in January 2009, 643,000 people were homeless. Nearly two-thirds stayed in an emergency shelter or transitional housing program and the other third were living on the street, in an abandoned building, or another place not meant for human habitation.
- The number of homeless persons on the night of the PIT count decreased 3.2 percent from January 2008 to January 2009. However, this decline reflects a steep decline in the homeless population of a single city, Los Angeles. Removing Los Angeles from both counts, the total number of homeless people increased although the number of unsheltered homeless people still decreased.
- A majority of CoCs reported an increase in sheltered homelessness and a decrease in unsheltered homelessness. Communities may be successfully moving people of the street and into shelter or other forms of housing.
- Large coastal states-California, New York, and Florida-accounted for 39 percent of people who were homeless on the night of the PIT count. Several other western states, besides California, had large shares of homeless people compared to their total state populations.
- Chronic homelessness seems to have continued a long-term pattern of decline between 2008 and 2009.

Results from one-year estimates from HMIS data:

- Nearly 1.56 million people spent at least one night in an emergency shelter or transitional housing program between October 1, 2008 and September 30, 2009.
- Nearly 35,000 fewer people used emergency shelter or transitional housing in 2009 than in 2008. However, the number of families in homeless programs increased by nearly 11,000 . Since 2007 there has been a nearly 30 percent increase in the number of sheltered families.

This page intentionally left blank

## Chapter 3 <br> Sheltered Homeless People in 2009

This chapter provides a profile of the estimated 1.56 million sheltered homeless people in 2009. The chapter is based on HMIS data reported by 334 jurisdictions nationwide and weighted to represent the entire nation. The data were collected on anyone who used an emergency shelter or transitional housing program at some time from October 2008 through September 2009.

As in past reports, the profile of sheltered homeless people focuses on three topics:

- The demographic characteristics of sheltered homeless people. Who were the sheltered homeless? How did the characteristics of homeless people compare to those of the overall population living in poverty and the U.S. population as a whole?
- The location of homeless service use. In what types of communities (urban, suburban or rural) did people use emergency and transitional housing programs? Where did they stay before using residential homeless services?
- The patterns of homeless service use. How did people use emergency and transitional housing programs? How long did people stay in homeless residential facilities?

These topics are discussed for the total, sheltered homeless population and separately for individuals and for persons in families. Most individuals are unaccompanied adults. For the purposes of this report, a family includes persons in households with at least one adult and one child, so all other households (e.g., unaccompanied youth and two adults who are homeless together but without children) are considered to be homeless as individuals.

## Definition of Sheltered Homeless Individuals and Persons in Families

- Sheltered homeless individuals include single adults, unaccompanied youth, persons in multi-adult households, and persons in multi-child households.
- Sheltered homeless persons in families include persons in households with at least one adult and one child.

### 3.1 Characteristics of People Using Homeless Shelters, 2009

## Characteristics of All Sheltered Persons

Homelessness can befall people of all genders, races and ages. A portrait of the estimated 1.6 million people who used a shelter between October 2009 and September 2010 is provided in Exhibit 3-1. In 2009, a typical sheltered homeless person had the following characteristics:

> A typical homeless person is a middleaged, adult male who is a member of a minority group and is by himself.

- Adult-78 percent of all sheltered homeless persons are adults.
- Male-61 percent are male.
- Minority - 62 percent are members of a minority group.
- Middle-age- 38 percent are 31 to 50 years old.
- Alone- 64 percent are in one-person households.
- No special needs - 62 percent do not have a disability.

Exhibit 3-1 also compares the characteristics of the sheltered homeless population with those of the U.S. poverty and total populations, highlighting several important differences. When compared to these populations, homeless people are much more likely to be adult males, African-Americans, not elderly, alone, veterans, and disabled.

Adult males. Adult men are overrepresented in the sheltered homeless population. An estimated 63.7 percent of homeless adults are men, compared to 48.7 percent of the overall population and 40.5 percent of the poverty population. As noted in previous reports, the large proportion of adult men in the shelter system is likely associated with several factors: gaps in the Unemployment Insurance program; an inability to qualify for the largest safety net programs (e.g., Temporary Assistance for Needy Families and Social Security); ${ }^{13}$ higher rates of substance abuse than among women; and a greater likelihood that men have institutional histories that are related to homelessness (e.g., incarceration). ${ }^{14}$

[^9]Exhibit 3-1: Demographic Characteristics of Sheltered Homeless Persons in 2009 Compared to the 2008 U.S. and Poverty Populations

| Characteristic | Percentage of All Sheltered Homeless Persons, 2009 | Percentage of the 2008 U.S. Poverty Population | Percentage of the 2008 U.S. <br> Population |
| :---: | :---: | :---: | :---: |
| Gender of Adults |  |  |  |
| Male | 63.7\% | 40.5\% | 48.7\% |
| Female | 36.3\% | 59.5\% | 51.3\% |
| Ethnicity |  |  |  |
| Non-Hispanic/non-Latino | 80.5\% | 75.1\% | 84.6\% |

| Veteran (adults only) ${ }^{\text {c }}$ | 11.1\% | 5.2\% | 9.7\% |
| Disabled (adults only) ${ }^{\text {c }}$ | 37.8\% | 26.2\% | 15.5\% |

a Age is calculated based on a person's first time in shelter during the one-year reporting period.
${ }^{\text {b }}$ If a person is part of more than one household or the household size changed during the reporting period, the household size reflects the size of the first household in which the person presented during the one-year reporting period. For all population types, past reports counted each person in a multi-adult or multi-child household as an individual household composed of one person. In this report, persons in these households are counted as one household composed of multiple people. For example, a household composed of two adults with no children is counted as one household with a household size equal to two, rather than two households with each household size equal to 1 .
c Veteran and disability status are recorded only for adults in HMIS. The percentage calculations shown indicate the percent of homeless adults with this characteristic. Some records were missing information on disability status ( 10.5 percent) and veteran status ( 5.3 percent) in 2009. The percentage calculations are for those whose disability and veteran status was known.

Sources: Homeless Management Information System data, 2009; 2008 American Community Survey

African Americans. African Americans represent 38.7 percent of the sheltered homeless population, more than 3 times their share of the U.S. population and about 1.75 times their share of the poverty population. The overrepresentation of African Americans in the homeless population is related to urban concentrations of homelessness. According to 2008 data from the U.S. Census Bureau, about 46 percent of the African American population and 57.7 percent of the poor African American population lives in principal cities. By contrast, only 16 percent of the white non-Hispanic population and 35 percent of the white Hispanic population lives in these areas. ${ }^{15}$

Non-elderly. Only 2.8 percent of the sheltered homeless population is 62 years old or older, compared to 11.3 percent of the poverty population and 15.4 percent of the total U.S. population. The lower rate of elderly people among the shelter population is likely associated with two factors. First, an array of social safety-net programs in the United States for people aged 65 or older-including Supplemental Security Income (SSI), Social Security, Medicare, and public and other assisted housing for seniors-should help many vulnerable persons avoid shelter. Second, medical morbidity rates - or the incidence of a disease, mental health issues, or substance abuse disorders-are much higher among homeless people, especially chronically homeless persons. ${ }^{16}$ High medical morbidity rates, in turn, place homeless people at higher risk of mortality than their housed counterparts. Homeless people are 3 to 4 times more likely to die prematurely than the general population. ${ }^{17}$

Alone. Nearly two-thirds of the total sheltered population (64.1 percent) are in single-person households, nearly 4 times the proportion of such households in the poverty population and about 5 times the proportion in the national population. ${ }^{18}$ Since most homeless individuals are men, the reasons both single-person households and men are disproportionately represented in the sheltered homeless population are likely the same.

[^10]Veterans. Veterans are slightly more likely to be represented in the sheltered homeless population than the general population. Veterans represent about 11.1 percent of all sheltered adults, compared to 5.2 percent of the poverty population and 9.7 percent of the total U.S. adult population. Many veterans confront the same issues that lead others into homelessness, such lack of affordable housing and inadequate income and savings. But they also have barriers that can be particularly acute among service-men and -women returning from active duty, such as the lingering effects of posttraumatic stress disorder (PTSD) and substance abuse. These issues can make it difficult for veterans to find and maintain gainful employment, which in turn can make it difficult to pay for housing.

| When compared to |
| :--- |
| their counterparts |
| nationwide, |
| homeless people |
| are much more |
| likely to be adult |
| males, African- |
| Americans, non- |
| elderly, alone, |
| veterans, and |
| disabled. |

When compared to their counterparts nationwide, homeless people are much more likely to be adult males, AfricanAmericans, nonelderly, alone, veterans, and disabled.

Disabled. Nearly four in ten sheltered adults ( 37.8 percent) has a disability, compared to 26.2 percent of the poverty population and 15.5 percent of the total U.S. population. ${ }^{19}$ Thus, a homeless adult is nearly 2.5 times more likely to have a disability than an adult in the U.S. population. The higher disability rates among the homeless population are expected because a disability, particularly one relating to substance abuse or mental health, can make it difficult to work enough to afford housing. People with disabilities also have higher rates of housing discrimination and, therefore, may have difficulties finding suitable housing. ${ }^{20}$

Finally, as noted in the 2008 AHAR, the ability of SSI and SSDI to avert homelessness among persons with disabilities is uncertain. A disabled person whose only income in 2009 was a monthly SSI payment in 2009 was well under the poverty level for a single-person household. The average annual SSI payment is about 44 percent below the poverty level. ${ }^{21}$ Even so, only an

[^11]estimated 10 to 15 percent of homeless people received SSI or SSDI assistance. ${ }^{22}$ Many homeless people who qualify for assistance do not apply or fail to complete the application process because the process is daunting and particularly difficult for people with severe mental illness. Also, several common types of disabilities among homeless people, such as substance abuse issues and personality disorders, are not eligibility criterion for SSI.

Among all people in the United States, about 1 in 195 used a homeless residential facility at some time during the 12 month reporting period. The likelihood of using a residential homeless facility is much higher for some population groups (Exhibit 3-2). The highest risk groups are African Americans (1 in 67) and adult men (1 in 145). Among all those who are poor, about 1 in 25 is likely to enter shelter at some time during the year, and the variations among particular types of poor people are equally striking. Veterans ( 1 in 10), adult men ( 1 in 14), and African Americans (1 in 15) in poverty are at highest risk of becoming homeless.

## Characteristics of Sheltered Homeless Individuals and Persons in Families

Among the estimated 1.56 million homeless people in shelter, about two-thirds are homeless as individuals ( 66 percent) and about one-third are persons in families ( 34 percent). Considered as households rather than separate people, there were about 170,000 sheltered families, or 14.3 percent of all sheltered homeless households. ${ }^{23}$ As shown in Exhibit 3-3, the overwhelming majority of homeless individuals are unaccompanied adult men. Only a quarter of

[^12]are unaccompanied adult females. However, the profile of the individual homeless population varies from community to community, and the site visits conducted for this report provided an opportunity to explore some of this variation (see side bar on "Local Faces of Individual Homelessness").

As Exhibit 3-3 suggests, very few people are homeless only with other adults or are people under age 18 without accompanying adults. ${ }^{24}$ Together, these groups represent only 4 percent of all sheltered homeless individuals. About three fifths of homeless people in families are children under age 18 ( 61 percent); the rest are adults ( 39 percent).

## Exhibit 3-3: Household Composition of Sheltered Individuals and Persons in Families, 2009

Single adult male households
$\square$ Single adult female households
-Unaccompanied youth and several-children households
Several-adult households

The portrait of homelessness differs significantly by household type-that is, people who are homeless by themselves are very different than those who are homeless as part of a family. In 2009, sheltered homeless individuals and persons in families looked different along several key characteristics (see Exhibit 3-4 for more details).

[^13]| Characteristic | Sheltered Individuals | Sheltered Persons in Families |
| :---: | :---: | :---: |
| Gender of Adults | - Overwhelmingly male | - Overwhelmingly female adults |
| Race | - Nearly as likely to be a non-minority | - Almost half are African-Americans |
| Age | - Three-quarters are over 30 | - More than four-fifths are under 31 |
| Veterans | - More than 1 in 10 are veterans | - Very unlikely to be a veteran |
| Disabled | - More than 4 in 10 are disabled | - Low rates of disability |

Gender of Adults. Most sheltered homeless individuals are men. In 2009, 71 percent of all sheltered individuals were adult men and only 25 percent were adult women staying alone. Assuming that most homeless persons are poor before using a shelter, the high rate of men among individuals suggests that for every 14 men living by themselves with incomes below the poverty line, 1 is likely to access a homeless shelter at some time during the year. Only 1 of every 35 women living alone in poverty access the homeless shelter system By comparison, adults who become homeless together with children are usually, but not always, women. In 2009, 79.6 percent of adults in families with children were women. Women in families with incomes below the poverty line are 2 times more likely to use a shelter than their male counterparts.

Race. Even though the majority of all sheltered people are minorities, almost half of all individuals (45.4 percent) are white and not Hispanic. By contrast, less than one-quarter of persons in families are non-Hispanic and white ( 23.6 percent) and nearly half are African American (47.9 percent). Thus, people of different racial and ethnic groups may experience homelessness differently-non-minorities more often as single persons and minorities more often with accompanying children.

The profile of homeless individuals and persons in families differs considerably, especially in terms of gender, race, age, and veteran and disability status.

Age. Half of all homeless individuals in shelter are 31-50 years old and three-quarters are over age 30. Sheltered families are much younger. Three-fifths of all persons in families are children (under age 18), and more than half ( 55.2 percent) of the adults in families are between age 18 and 30. Homeless children in shelters are also fairly young. More than half (52.6 percent) are under age $6 ; 32.5$ percent are age 6 to 12 , and 14.8 percent are age 13 tol7.

Veteran Status. A much larger proportion of adult individuals are veterans compared to adults in families. An estimated 13.0 percent of adult individuals are veterans compared to 2.1 percent of adults in families. The higher rate of veterans among individuals is expected because the overwhelming majority of sheltered individuals are men and men are more likely to be in the military.

Disability. More than 4 in 10 individual homeless adults ( 42.9 percent) have disabilities, compared to 14 percent of adults in families. The significantly higher prevalence of disabilities among homeless individuals is likely explained by the disproportionate presence of older people and men in individual homeless households. Many epidemiologic survey studies have shown
that rates of drug and alcohol disorders are consistently higher among men than among women. For example, the National Epidemiologic Survey on Alcohol and Related Conditions (NESARC) surveyed more than 40,000 adults and found that men are twice as likely as women to abuse drugs and three times more likely to abuse alcohol. ${ }^{25}$

## Local "Faces" of Individual Homelessness

City of Detroit. The typical homeless individual in Detroit is similar to the national average: he is an African-American man between the ages of 31 and 50. However, providers in Detroit also described other types of individuals in need of housing. Senior citizens, for example, comprise an increasing share of Detroit's homeless population. As described further in Chapter 4, some of these seniors have been homeless for much of their adult lives, while others only became homeless after retirement. Detroit providers also report that the city has a large population of homeless teens (aged 17 to 20) who have trouble leasing housing on their own, struggle in doubled-up situations, and are turned away from shelters that cannot accommodate teenage boys.

Seaside and Monterey Counties. In Seaside and Monterey Counties, on the central Californian coast, homeless individuals are more likely to be white and female. They are also somewhat more likely to be young, between the ages of 18 and 30 . But providers also report that the number of older single women accessing homeless services is on the rise. Most of these women are single following a divorce or as a result of domestic violence, and many have recently lost their jobs. Some became homeless after their apartment building went into foreclosure. Locally, there are few services dedicated to serving senior homeless women, and providers that typically serve individuals struggle to accommodate their needs.

Phoenix and Maricopa County. Phoenix and Maricopa County (Arizona) also have a relatively large proportion of single homeless women. Providers suggest that they have seen a significant increase in single adult homelessness and that this trend is likely to continue into the next year. They report that single women are more likely than women in families to have severe mental disabilities and a history of drug addiction. They also suggest that single women are hard to engage in housing and servicers when transitional housing and permanent supportive housing programs require treatment compliance.

Idaho Balance of State. In contrast to the national average, the individual homeless population in the Idaho Balance of State Continuum of Care is predominantly white and mostly between the ages of 18 and 30 . The majority of homeless individuals are men, but women make up about one-third of the emergency shelter population and about one-fifth of the transitional housing population.

[^14]
## Exhibit 3-4: Demographic Characteristics of Sheltered Homeless Persons by Household Type, 2009

| Characteristic | Percentage of All Sheltered Homeless Population | Percentage of Individuals | Percentage of Persons in Families |
| :---: | :---: | :---: | :---: |
| Gender of Adults |  |  |  |
| Male | 63.7\% | 72.7\% | 20.4\% |
| Female | 36.3\% | 27.3\% | 79.6\% |
| Ethnicity |  |  |  |

| Race |  |  |  |
| White, Non-Hispanic | 38.1\% | 45.4\% | 23.6\% |
| White, Hispanic | 11.6\% | 10.4\% | 13.9\% |
| Black or African-American | 38.7\% | 34.1\% | 47.9\% |
| Other Single Race | 4.7\% | 3.8\% | 6.2\% |
| Multiple Races | 7.0\% | 6.4\% | 8.5\% |
| Age ${ }^{\text {a }}$ |  |  |  |
| Under age 18 | 22.2\% | 2.2\% | 60.6\% |
| 18 to 30 | 22.3\% | 22.6\% | 21.8\% |
| 31 to 50 | 38.3\% | 49.7\% | 16.4\% |
| 51 to 61 | 14.4\% | 21.3\% | 1.1\% |
| 62 and older | 2.8\% | 4.2\% | 0.1\% |
| Household Size ${ }^{\text {b }}$ |  |  |  |
| 1 person | 64.1\% | 97.2\% | 0.0\% |
| 2 people | 10.0\% | 2.5\% | 24.4\% |
| 3 people | 10.2\% | 0.2\% | 29.4\% |
| 4 people | 7.9\% | 0.1\% | 23.0\% |
| 5 or more people | 7.9\% | 0.0\% | 23.1\% |
| Special Populations |  |  |  |
| Veteran (adults only) ${ }^{\text {c }}$ | 11.1\% | 13.0\% | 2.1\% |
| Disabled (adults only) ${ }^{\text {c }}$ | 37.8\% | 42.9\% | 14.0\% |

${ }^{\text {a }}$ Age is calculated based on a person's first time in shelter during the one-year reporting period.
${ }^{b}$ If a person is part a household consisting of more than one person or the household size changed during the reporting period, the household size reflects the size of the first household in which the person presented during the one-year reporting period.
c Veteran and disability status are recorded only for adults in the HMIS. The percentage calculations are for homeless adults with this characteristic. Some records were missing information on disability status ( 10.5 percent) and veteran status ( 5.3 percent) in 2009. The percentage calculations include only persons whose disability or veteran status was known.

Source: Homeless Management Information System data, 2008

In addition to these characteristics, sheltered families are also larger than individual households, as expected. A typical homeless family consists of a mother and two children (the average number of children per family is 1.9). As demonstrated in Exhibit 3-5, homeless families have smaller household sizes than both the poverty population and the total U.S. population. Fewer than one-quarter of sheltered families ( 23.1 percent) have large families (5 or more people), compared with about 4 in 10 families in poverty. The household sizes among homeless families suggest that some homeless families could be appropriately housed in a twobedroom apartment or house. ${ }^{26}$

| Exhibit 3-5: | Household Sizes of Sheltered Homeless Families and Poor Families 2008 |  |  |
| :--- | :---: | :---: | :---: |
| Household Size | Percentage of <br> Sheltered Homeless <br> Families | Percentage of Poor <br> Families | Percentage of All <br> Families in the U.S. |

### 3.2 Location of Homeless Service Use, 2009

## Geographic Location of Sheltered Homeless Persons

Sheltered homelessness is concentrated in urban areas (see Exhibit 3-6). About 68.2 percent of all sheltered homeless people are located in principal cities, and less than one-third (31.8 percent) are in suburban or rural jurisdictions. Homeless individuals are particularly likely to be in urban areas. Nearly three-quarters of all sheltered individuals ( 72.2 percent) accessed a homeless residential program that is located in a principal city, compared with 61.2 percent of persons in families.

The geographic distribution of sheltered homelessness is markedly different than the distribution of the nation's poverty and total populations. The share of sheltered homeless people in principal cities is nearly twice the share of the poverty population in these areas ( 68.2 versus 35.6 percent) and almost three times the share of the entire U.S. population ( 68.2 percent versus 24.3 percent). About 1 in every 92 persons living in a principal city in the United States was homeless in emergency shelter or transitional housing, compared with about 1 in every 415 persons living in a suburban or rural area.

[^15]As noted in previous reports, the concentration of homeless people in urban areas is related to several issues:

- Principal cities have high rates of unemployment and lack of affordable housing, which are risk factors for homelessness.
- The social service system in large cities may be saturated or experiencing large funding reductions, which may limit the ability of these systems to adequately serve persons at risk of becoming homeless.
- The majority of homeless residential services are located in principal citiesapproximately 51.6 percent of all programs and 65.4 percent of beds for homeless persons are located in these areas. ${ }^{27}$ The location of homeless residential services in principal cities may produce a "magnet effect," attracting homeless people to the area because services are more accessible than elsewhere. While plausible, this interpretation is complicated by the difficulty in establishing cause-and-effect: do homeless people move to service-rich areas or are homeless service providers purposively located where the demand for services is greatest? Future analysis in the AHAR will explore ways to disentangle these issues.

Sources: Homeless Management Information System data, 2009

[^16]
## Movement into the Shelter System

Communities participating in the AHAR provided information on where people stayed the night before they entered an emergency shelter or transitional living facility. The information is associated with each person's first program entry during the 12-month reporting period. Thus, this information is intended to suggest how people flow into the homeless residential system, rather than how people churn through the system.

In 2009, the night before entering shelter, almost two-fifths of all sheltered persons ( 38.5 percent) came from another homeless situation. Among those who were already homeless, more than one-half came from an emergency shelter ( 54.9 percent), nearly two-thirds came from an unsheltered situation ( 38.6 percent), and a few came from transitional housing ( 6.6 percent). Another two-fifths of all sheltered persons (41.1 percent) moved from a housed situation (their own or someone else's home), and the remaining one-fifth were split between institutional settings (e.g., a substance abuse facility or jail) and hotels, motels, or other unspecified living arrangements (see Exhibit 3-7). The most common prior living arrangement among all sheltered people was with friends or family ( 29.5 percent) and staying in another homeless residential service facility ( 23.7 percent).

| Exhibit 3-7: Previous Living Situation of People Using Homeless Residential Services, $2009{ }^{\text {a }}$ |  |  |  |
| :---: | :---: | :---: | :---: |

| a The exhibit reports on adults and unaccompanied youth only because the HMIS Data and Technical Standards require the information to be collected only from these persons. About 11 percent of the records in HMIS were missing this information in 2009. |  |  |  |
| This category includes unaccompanied adults and youth as well as multiple-adult households without children. Includes a small percentage in permanent supportive housing. |  |  |  |

Sources: Homeless Management Information System data, 2009

A comparison of living arrangements between sheltered individuals and persons in families reveals several striking differences. More than 6 in 10 persons in families ( 62.6 percent) came from a housed situation, including almost onethird (29.4 percent) who were staying with family and onefifth who came from a rented or owned housing unit (19.7 percent) prior to entering the shelter system. Slightly over one-quarter of persons in families were already homeless prior to entering the shelter system during the one-year reporting period ( 26 percent). A very small proportion of persons in families were in institutional settings ( 2.7 percent). By comparison, homeless individuals were much more likely than family members to be already homeless and come from institutional settings. Fewer than 4 in 10 individuals came from a housed situation ( 36.6 percent), and more than 1 in 10
 were in a medical or correctional facility ( 14.5 percent) just prior to entering the shelter system. Thus, for individuals, the most common pathway into the shelter system during the one-year reporting period was another homeless location, whereas among persons in families it was from their own housing or someone else's.

Focusing on people who were not homeless prior to entering shelter, less than one-fifth came from their own housing unit (18.7 percent) nearly one-half were staying with family or friends (48.0 percent), about one-fifth were previously in an institutional setting (19.6 percent), and the rest were in other locations ( 13.7 percent). Thus, for people who were not already homeless, more than two thirds were "housed" in their own unit or someone else's, and the single most common pathway into the shelter system was staying with family or friends.

But here, again, the pathway into homelessness for those who were not previously homeless varies dramatically by household type. Less than one-half of individuals had been staying with family or friends ( 45.4 percent), compared with 58.0 percent of adults in families. Only 16.7 percent of individuals had been in their own housing unit, compared with 26.6 percent of families. Many more individuals than families came from institutional settings, 24.6 percent vs. 3.6 percent.

About 85 percent of adults in families who were not previously homeless were staying with family and friends or living in their own place just prior to entering the shelter system. This finding is especially useful to local programs that are designing targeted approaches to preventing homelessness among families. The finding suggests that homelessness prevention programs may be particularly successful at staving off homelessness among families with services that help families retain their existing housing, such as emergency rental assistance or family mediation services.

### 3.3 Patterns of Homeless Service Use, 2009

## Emergency Shelters or Transitional Housing

A long-standing assumption about how homeless people use a community-wide, homeless residential service system is that people flow linearly through the shelter system-entering first into an emergency shelter, moving on to transitional housing, and then eventually finding a permanent (or permanent supportive) housing arrangement. The 2009 estimates further support previous findings that few sheltered homeless persons follow a linear progression through the shelter system during a 12 -month period.

As shown in Exhibit 3-8, very few sheltered persons use multiple program types. In 2009, more than three-quarters of the estimated 1.56 million homeless people in shelter used an emergency shelter only ( 77.4 percent), less than onefifth used a transitional housing program only (18.3 percent), and a small proportion of people used both types of homeless residential facilities (4.3 percent).

These estimates do not describe the potential "churning" that may exist within the homeless residential system-that is, people who repeatedly cycling in and out of emergency shelters or transitional housing during the one-year reporting

Source: Homeless Management Information System data, 2009 period. Nonetheless, the estimates reinforce findings from previous studies that concluded, similarly, that few homeless persons use the shelter system sequentially and some use the system in unpredictable ways (e.g., starting in transitional housing and then entering an emergency shelter). ${ }^{28}$ Others find ways to resolve their homeless episode fairly quickly and, as a result, do not use transitional housing. ${ }^{29}$

[^17]Service use patterns vary slightly by household type. Homeless individuals are more likely than persons in families to use an emergency shelter only ( 81.2 percent versus 70.1 percent) and less likely to use a transitional housing program only ( 14.5 percent versus 25.0 percent). Homeless individuals and persons in families are equally likely to use both types of programs (4.3 percent versus 4.9 percent). The slight difference in service use patterns among household types is explained in part by the relative supply of different types of residential homeless programs for individuals and families, a topic discussed in chapter 5. It also is possible that families try to avoid emergency shelters if possible because these facilities are particularly unsuitable for children. Some families may try to bypass shelters altogether and go directly to transitional housing.

## Length of Stay in Emergency Shelters and Transitional Housing

Many sheltered homeless people experience short-term episodes of homelessness and only use emergency shelter for a few days. The short-term nature of sheltered homelessness is demonstrated in Exhibit 3-9, which shows the number of nights in residential homeless programs by household type. The estimates represent the cumulative amount of time spent in residential programs - meaning that if a person had three program stays in emergency shelter, for example, and each stay was 7 nights, then the person experienced 21 nights of homelessness in emergency shelters.

Exhibit 3-9: Number of Nights in Shelter by Program and Household Type, 2009

|  | Emergency Shelters |  |  | Transitional Housing |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Tetal | Individuals | Persons in <br> Families | Total | Individual | Persons in <br> Families |
|  |  |  |  |  |  |  |
| 1 week or less | $33.5 \%$ | $37.9 \%$ | $23.9 \%$ | $5.0 \%$ | $6.5 \%$ | $3.2 \%$ |
| 1 week to < 1 month | $26.6 \%$ | $28.0 \%$ | $23.5 \%$ | $11.2 \%$ | $13.3 \%$ | $8.6 \%$ |
| 1 month to < 6 months | $33.4 \%$ | $29.4 \%$ | $42.1 \%$ | $44.0 \%$ | $47.6 \%$ | $39.5 \%$ |
| 6 months to < 1 year | $5.4 \%$ | $4.0 \%$ | $8.5 \%$ | $24.9 \%$ | $21.2 \%$ | $29.3 \%$ |
| Entire year | $1.2 \%$ | $0.8 \%$ | $2.0 \%$ | $15.0 \%$ | $11.4 \%$ | $19.3 \%$ |
| Average (Median) Time |  |  |  |  |  |  |
| \# of nights | 22 | 17 | 36 | 133 | 107 | 174 |

a The length of stay reported in this exhibit accounts for the total number of nights in shelters during the 12-month reporting period. Some people may have lengths of stay longer than a year if they entered a residential program prior to the start of the data collection period or remained in the program after the end of the data collection period.

Source: Homeless Management Information System data, 2009

During the one-year reporting period, one-third of all people in emergency shelters ( 33.5 percent) stayed for less than 1 week, and three-fifths ( 60.1 percent) stayed less than a month. Very few people stayed 6 months or more ( 6.6 percent). Individuals in emergency shelters stayed the shortest amount of time - nearly 4 in 10 stayed less than 1 week ( 37.9 percent), and almost twothirds stayed less than one month ( 65.9 percent). The median length of stay for individuals in emergency shelters was 17 days. By comparison, families in emergency shelters stayed longerabout one-quarter stayed 1 week or less ( 23.9 percent) and less than half stayed less than one month (47.4 percent). Twice as many persons in families than individuals stayed for 6 months or more, and the median length of stay among family members was 36 days.

As described in previous reports, the longer lengths of stay among families is expected because unsheltered homelessness can be particularly dangerous for families with children, and families may have a more difficult time finding affordable and appropriately-sized housing. (As shown in Exhibit 3-5, about 4 in 10 sheltered persons in families have 4 or more household members.)

People in transitional housing programs generally stay for much longer periods of time, which is expected because these programs are designed to serve clients for up to two years while helping them transition to permanent housing. In 2009, the average (median) length of stay in transitional housing was 133 nights (or about four and one-half months), and about 40 percent of all persons stayed in transitional housing for 6 months or more ( 39.9 percent). A considerable proportion of people stayed for the full 12-month reporting period (15.0 percent). Here again, persons in families stay longer than individuals. The median number of days among persons in families was 174 compared to 107 for individuals, and nearly 1 in 5 persons in families stayed for 12 months ( 19.3 percent) compared to about 1 in 10 individuals ( 11.4 percent).

## "Heavy Users" of Emergency Shelters

Communities participating in the 2009 AHAR were asked to report the number and the characteristics of "heavy users" of the homeless services system, or people who stayed in emergency shelters for six months or longer during the one-year reporting period. These heavy users represent only 6.5 percent of all persons who used emergency shelters in 2009 (or about 83,000 people out of the 1.27 million shelter users). Heavy users are nearly as likely to be individuals as persons in families.

As shown in Exhibit 3-10, heavy users of emergency shelters look very different from those who use shelters less intensely. Heavy users are much more likely to be minorities (Hispanics and African Americans). They also are more likely to be in families-that is, to have children under age 18 and to have larger families than all people in emergency shelters.

| Race | All Persons in Emergency Shelters in 2009 | Long-Term Stayers in Emergency Shelters in 2009 |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Total ${ }^{\text {a }}$ | Individuals | Persons in Families |
| Hispanic/Latino Ethnicity | 19.8\% | 31.2\% | 17.4\% | 44.9\% |
| Black or African American | 38.6\% | 56.0\% | 45.2\% | 68.8\% |
| Children under Age 18 | 20.2\% | 30.5\% | 1.2\% | 59.4\% |
| Household with 5 or more People | 7.4\% | 13.3\% | 0.0\% | 26.6\% |
| Number of People | 1,274,301 | 82,978 | 41,835 | 42,140 |
| The number of long-terms stayers who were individuals and persons in families will not sum to the total number of long-term stayers because a small proportion of persons (about 1 percent) were served as both individuals and as persons in families during the 12 -month reporting period. |  |  |  |  |

### 3.4 Summary of All Sheltered Homeless People in 2009

The estimates of the sheltered homeless population in 2009 indicate that:

- A typical sheltered homeless person-whether an individual or a member of a family-is a middle-aged, adult male who is a member of a minority group and is homeless by himself. Chances are that he does not have any type of disability.
- When compared to their counterparts nationwide, sheltered homeless people are much more likely to be adult males, African-Americans, non-elderly, alone, veterans, and disabled.
- Homeless sheltered individuals most often are male, over age 30, disabled, and experiencing homelessness alone. By contrast, family households in the shelter system are very likely to be headed by a minority woman without a male partner, under age 30 , and in a household with 2 or 3 members.
- About 68.2 percent of all sheltered homeless people are located in principal cities, and less than one-third ( 31.8 percent) are located in suburban or rural jurisdictions.
- About 1 in every 92 persons living in principal cities in the United States was homeless, compared with about 1 in every 415 persons living in suburban or rural areas.
- The share of sheltered homeless people in principal cities is nearly twice the share of the poverty population in these areas ( 68.2 versus 35.6 percent) and almost three times the share of the entire U.S. population ( 68.2 percent versus 24.3 percent).
- In 2009, the night before entering shelter, almost two-fifths of all sheltered persons came from another homeless situation, another two-fifths moved from a housed situation (their own or someone else's home), and the remaining one-fifth were split between institutional settings and hotels, motels, or other unspecified living arrangements.
- The most common pathway into the shelter system for homeless individuals was another homeless location, whereas among persons in families it was from a housed situation.
- During the one-year reporting period, one-third of all people in emergency shelters stayed for less than 1 week, and three-fifths stayed less than a month. About 40 percent of all persons in transitional housing stayed for 6 months or more.
- Heavy users of emergency shelters look very different than those who use shelters less intensely. Heavy users are much more likely to be minorities (specifically Hispanics and African Americans), have children under age 18, and have larger families than all people in emergency shelters.

## Chapter 4 <br> Trends in Sheltered Homelessness between 2007 and 2009

The 2008 AHAR was the first to describe year to year changes in the sheltered homeless population. Now, in this 2009 AHAR, we can look across three years of HMIS data and present both changes that occurred between the most recent two years, 2008 and 2009, and changes across the three year period from 2007 through 2009.

The chapter focuses on three types of changes:

- Changes in the sheltered homeless population between 2007 and 2009, including the number of people, the types of locations in which they are homeless, and their demographic characteristics.
- Changes in the patterns of becoming homeless, based on information about where people were the night before they became homeless and how long they had been there.
- Changes in how people use the homeless services system and, specifically, whether they use emergency shelter or transitional housing and how long they stay in residential programs for homeless persons during a 12 -month period.

The HMIS-based estimates discussed in this chapter are considerably more robust than those based on PIT data. Unlike PIT data, HMIS data are not influenced heavily by unexpected events that may occur on the night of the point-in-time count, such as a winter storm, or by variations in enumeration strategies. HMIS is now a widely used tool, and communities are increasingly capable of collecting and reporting reliable HMIS data to the AHAR. As a result, the precision of the HMIS-based estimates has continued to improve with each successive report. More importantly, the HMIS-based estimates presented in this chapter begin to show a few consistent patterns that we believe are real, despite the fact that some communities were unable to provide complete data and thus the estimates have wide confidence intervals (Exhibit 4-1).

### 4.1 Changes in the Sheltered Homeless Population between 2007 and 2009

Overall sheltered homelessness declined slightly between 2008 and 2009, by about 35,000 people or 2 percent of the number of sheltered homeless people in 2008 (Exhibit 4-1). Individual sheltered homelessness dropped by almost 58,000 people or 5 percent, while sheltered homeless persons in families increased by almost 19,000 people or 3.6 percent.

When families are considered as households rather than as the separate people in the households, the increase was almost 11,000 families between 2009 and 2008, a 7 percent increase over the 159,142 sheltered homeless families in 2008.

| Exhibit 4-1: Changes in Total Sheltered Homeless Individuals and Persons in <br> Families, 2008-2009 |
| :--- |

a These estimated totals reflect the number of homeless persons in the 50 states and the District of Columbia who used emergency shelters or transitional housing programs during the one-year period of October 1 through September 30 of the following year. The estimates do not cover the U.S. Territories and Puerto Rico and do not include persons served by "victim service providers." The estimated totals include an extrapolation adjustment to account for people who use emergency shelters and transitional housing programs but whose jurisdictions do not yet participate in their HMIS. People who are homeless but do not use an emergency shelter or transitional housing program during the 12-month period are not included. Percentages may not sum to 100 percent due to rounding.
b This category includes unaccompanied adults, unaccompanied people under 18 years, and multi-adult households without children.
c In 2009, the 95 percent confidence interval for the estimated number of sheltered homeless persons in the population was $1,230,198$ to $1,887,636$ persons (or $+/-328,719$ persons). In 2008, the 95 percent confidence interval was $1,180,758$ to 2,006,830 (or $+/-413,036$ persons).
d In both 2008 and 2009, approximately 1 percent of homeless persons were served both as an individual and as a person in a family. In this exhibit, such people appear in both categories, so the total number of sheltered persons is slightly less than the sum of individuals and families.

Source: Homeless Management Information System data, 2007-2009

The overall number of sheltered homeless people had increased slightly between 2007 and 2008 before dropping slightly in 2009, as shown in Exhibit 4-2. The drop in sheltered homelessness among individuals was 80,000 people or about 7 percent across the three-year period from 2007 through 2009. The decline in the numbers of people in emergency shelters or transitional housing as individuals probably reflects community success in getting people out of shelters and into permanent supportive or other housing and also perhaps placing them into permanent housing directly from the street. Indeed, as shown in chapter 5, the inventory of beds in permanent supportive housing programs has increased dramatically, from about 177,000 to 219,000 beds.

Source: Homeless Management Information System data, 2007-2009

In contrast, in 2009, almost 62,000 more family members were in emergency shelter or transitional housing at some point during the year than had been in 2007. Considered as households rather than as separate people, the growth in sheltered family homelessness over the three years was almost 40,000 families or a 30 percent increase. The continued growth in sheltered family homelessness almost certainly reflects the ongoing effect of the recession.

Somewhat surprisingly, the increase in sheltered homeless families was more pronounced between 2007 and 2008 than between 2008 and 2009, even though the 2008 reporting period (October 2007 through September 2008) was fairly early in the recession, and unemployment rates remained high during the 2009 reporting period (October 2008 through September 2009). ${ }^{30}$ It may be that some families who were already at risk of becoming homeless and lacked sufficient support networks to ease the impact of the recession became homeless almost immediately. But a much larger group of families turned to family and friends to stave off the effects of the recession. Indeed, a recent study found that the recession has caused a dramatic increase, almost five-fold, in the rates of overcrowding, indicating that

30 According to the Department of Labor's Bureau of Labor Statistics, the seasonally adjusted unemployment rate increased from 6.6 percent to 9.8 percent between October 2008 and September 2009. By December 2009 (after the study period for this report), it had increased to 10.0 percent. See Bureau of Labor Statistics, U.S. Department of Labor, Databases, "Tables \& Calculators by Subject: Unemployment," http://www.bls.gov/data/\#unemployment (accessed May 11, 2010).
may families are doubling up in response to the economic downturn. ${ }^{31}$ Thus, the fortunes of many struggling families may still be in the balance. For some of these families, the fragile economic circumstances of the relatives and friends of struggling parents may mean that, as soon as job losses begin in an economic downturn, support networks for families at risk of homelessness fall apart. Doubled up housing situations cannot be sustained, cash is no longer available to help others with rent payments, and families turn to homeless shelters as the only way of keeping a roof over their heads. Then, as the recession continues, the flow of fragile families into homelessness remains at a high level but does not increase.

Alternatively, as the nation comes out of the recession and as the stimulus funding made available through the Homelessness Prevention and Re-housing Program (HPRP) begins to serve families, some of these at-risk families may avoid shelter altogether. (HPRP funding only started to become available in October 2009, the month after the 2009 AHAR reporting period ended). It is also possible that some of these families may find a way to regain their financial footing on their own and become self sufficient.

As a result of the slight drop in homelessness among individuals and the increase among families, family members represent a larger percentage of sheltered homeless people each year, rising from 29.8 percent in 2007 to 34.1 percent in 2009, as shown on Exhibit 4-3.

## Changes in the

Geography of Homelessness

The types of locations in which homeless people were found in emergency shelters or transitional

[^18]
## Impact of the Economic Downturn on Family Homelessness

From rural lowa to New York City, providers report increases in family homelessness they attribute to the recession. In San Francisco, for example, the waiting list for family shelter increased 30 percent between 2008 and 2009. In eight of the nine continuums visited for this report, providers noted a significant jump in the number of families in shelters or transitional housing who are homeless for the first time, mostly as a result of unemployment. In Phoenix, nearly half ( 47.9 percent) of families entering shelter in 2009 had not been homeless before, and in New York City, the rate of first-time homelessness among families is about 30 percent.

The Idaho Balance of State CoC has not yet seen a major increase in the number of homeless families, but providers expect this might be coming. Several Idaho providers noted an increase in the number of families accessing homeless services for the first-time and in the number of formerly "middle class" families seeking assistance. Memphis providers comment that families are increasingly being admitted to shelter with high debts, coming from expenses incurred while the family had employment.

Five of the communities reported longer stays by families in shelters as it takes longer to find employment that would allow them to secure permanent housing. For example, one transitional housing provider in Marshalltown, lowa, reported that prior to 2008, her facility served about two families per year, and these families would stay between two and four weeks. Since 2008, the facility has served 9 to 12 families per year, with an average length of stay of approximately four months.

Lack of employment opportunities and affordable housing are among the most common reasons cited by local providers for the rise in family homelessness. Although the typical homeless family is composed of a mother with children, providers in lowa, Monterrey, and Phoenix also report an increase in the number of two-parent families being served, signaling that the lack of employment is a critical factor in the growth of family homelessness. Also, the lack of affordable housing continues to play an important role in family homelessness in most communities, even though the recession has generally put downward pressure on rents. In some markets, such as Memphis, Tennessee, and Ames, lowa, the supply of affordable housing has decreased in recent years due to public housing transformation, Section 8 opt outs, and the redevelopment of alternative housing options, such as trailer parks. In other parts of the country, costs for rental housing remain high in spite of the recession. In San Francisco, for example, 20 to 25 percent of families in shelter have one adult who is working, suggesting that the lack of affordable housing is the major problem.
housing were almost exactly the same in 2009 as in 2008. About 68 percent of all sheltered homeless people were in principal cities and 32 percent in suburban and rural areas in both years, as shown in Exhibit 4-4. Between 2008 and 2009, the share of individuals in principal cities grew very slightly, from 71.0 percent to 72.2 percent, while the share of family members in suburban and rural areas grew by half a percentage point to 38.8 percent in 2009.

| Exhibit 4-4: Change in the Geographic Location of the Sheltered Homeless |
| :--- | ---: | ---: | ---: | ---: | :---: |
| Population, 2008-2009 |

Source: Homeless Management Information System data, 2008-2009

These very small changes in the locations of sheltered homeless people between 2008 and 2009 followed a much larger shift in the geography of sheltered homelessness between 2007 and 2008. Sheltered homelessness became markedly more suburban and rural between 2007 and 2008. In contrast the continued growth in family homelessness between 2008 and 2009 did not occur disproportionately in suburban and rural areas. Exhibit 4-5 shows the pattern across the three-year period.

Source: Homeless Management Information System data, 2007-2009

## Changes in the Demographic Characteristics of Homeless Individuals and Families

Overall, the demographic characteristics of sheltered homeless people did not change much over the three-year period from 2007 through 2009. The following exhibits (4-6 through 4-8) show a few notable changes: the aging of homeless population, the number of veterans and people with disabilities, the racial composition of sheltered homelessness, and the composition of homeless families. ${ }^{32}$

## Aging of the Homeless Population

Exhibit 4-6 shows a slight increase in the percentage of all homeless people who give their age as greater than 50 . This is consistent with other research that shows an increase in homelessness among a relatively older population as the baby boom generation ages. ${ }^{33}$ It is also consistent with the information gathered through interviews with homeless assistance providers in nine communities across the country. San Francisco, for example, has a large population of individuals who have been homeless for a long time and whose physical health

[^19]needs have increased over time. Providers in Detroit also commented on the aging of the homeless population.

| Characteristic | Percentage of All Sheltered Homeless Adults |  |  |
| :---: | :---: | :---: | :---: |
|  | 2007 | 2008 | 2009 |
| Age ${ }^{\text {a }}$ |  |  |  |
| 18 to 30 | 26.2\% | 28.0\% | 28.7\% |
| 31 to 50 | 52.7\% | 50.9\% | 49.2\% |
| 51to 61 | 17.4\% | 17.6\% | 18.5\% |
| 62 and older | 3.8\% | 3.5\% | 3.6\% |
| Veteran (adults) ${ }^{\text {a }}$ | 13.2\% | 11.6\% | 11.1\% |
| Disabled (adults) ${ }^{\text {a }}$ | 37.1\% | 42.8\% | 37.8\% |

${ }^{\text {a }}$ Age is calculated based on a person's first time in shelter during the covered time period. A child is defined as a person age 17 or under, and an adult is defined as a person age 18 or older.

Veteran status and whether a person had a disabling condition are recorded only for adults in HMIS. The percentage calculations shown indicate the percent of homeless adults with this characteristic. The number of records missing information on disability status dropped from 32.4 percent in 2007 to 22.0 percent in 2008 and 10.6 percent in 2009. Similarly, the percent of adults with missing information on veteran status dropped from 15.9 percent in 2007 to 7.5 percent in 2008 and to only 5.4 percent in 2009. The percentage calculations include only persons whose disability and veteran status was recorded.
Source: Homeless Management Information System data, 2007-2009

## Veterans and People with Disabilities in the Sheltered Homeless Population

Exhibit 4-6 also shows the percentages of homeless adults who reported being veterans and who reported having a disability in 2007, 2008, and 2009. Over time the rates of missing information for disability and veteran status have declined considerably, and as a result, the accuracy of these estimates has improved substantially. The slight drops between 2008 and 2009 in the percentages of all adults who report that they are veterans or that they have a disability may reflect more accurate estimates or may reflect the increase in family homelessness over the three-year period. Homeless adults in families are much less likely than individual adults to be veterans (because they are younger and less likely to be men) and also less likely to report having a disability. Substantial differences in disability rates and veterans status by household type have been observed repeatedly in past AHAR reports.

Interviews with homeless assistance providers conducted for this report suggest that veterans of the Iraq and Afghanistan conflicts have not yet become homeless in great numbers, perhaps because it takes some years for the mental disabilities associated with war to become acute. However, several providers suggested that that the average age of homeless veterans is decreasing. In Phoenix, for example, the average age of homeless veterans in 2009 was 47,
down from 57 only five years earlier. ${ }^{34}$ Providers also noted that they are seeing a "higher level of impairment" among homeless veterans, including more cases of substance abuse, PostTraumatic Stress Disorder (PTSD), traumatic brain injury and other mental and physical impairments. Several providers, including those in San Francisco, Monterrey and Phoenix, reported seeing an increase in homeless veteran families related to worsening economic conditions. As one California provider noted, "there are just no jobs when they are discharged."

## Race and Ethnicity of Sheltered Homeless People

Homelessness became somewhat more prevalent among people who are white and not Hispanic over the three-year period from 2007 to 2009. The share of sheltered homeless individuals who do not identify themselves as members of minority groups increased from 42.6 percent in 2007 to 45.4 percent in 2009 , and the share of sheltered homeless family members who were not minorities increased from 21.3 to 23.6 percent between 2007 and 2008 and held steady in 2009, as shown in Exhibit 4-7.

| Exhibit 4-7 Change in the Race and Ethnicity of Sheltered Homeless Individuals and Persons in Families, 2007-2009 ${ }^{\text {a }}$ |  |  |  |
| :---: | :---: | :---: | :---: |
| Sheltered Individuals |  |  |  |
| Race | \% of Individuals 2007 | $\begin{gathered} \hline \% \text { of Individuals } \\ 2008 \end{gathered}$ | $\begin{gathered} \text { \% of Individuals } \\ 2009 \end{gathered}$ |
| White, non-Hispanic/Latino | 42.6\% | 44.6\% | 45.4\% |
| White Hispanic, Latino | 14.1\% | 11.0\% | 10.4\% |
| Black or African American | 33.2\% | 37.0\% | 34.1\% |
| Other Racial Groups ${ }^{\text {b }}$ | 10.1\% | 7.5\% | 10.2\% |
| Sheltered Persons in Families |  |  |  |
| Race | \% of Persons in Families 2007 | \% of Persons in Families 2008 | \% of Persons in Families 2009 |
| White, non-Hispanic/Latino | 21.3\% | 24.4\% | 23.6\% |
| White Hispanic, Latino | 9.8\% | 13.1\% | 13.9\% |
| Black or African American | 55.2\% | 50.9\% | 47.9\% |
| Other Racial Groups ${ }^{\text {b }}$ | 13.6\% | 11.6\% | 14.7\% |

${ }^{\text {a }}$ Percentages may not sum to 100 percent due to rounding.
b Includes persons who identify as multiple races.
Source: Homeless Management Information System data, 2007-2009

34 The AHAR data collected for this report do not permit estimates of the age ranges of sheltered homeless veterans. A supplementary effort collected 2009 data just on veterans in the standard AHAR reporting categories, and an analysis of that information will be published later in 2010.

While African-American families and individuals have higher rates of homelessness than in the U.S. population as a whole or in the poverty population (see chapter 3), the share of sheltered homeless family members identifying themselves as black or African American decreased steadily over the three year period-for example, from 55.2 percent of persons in families in 2007 to 47.9 percent in 2009 (Exhibit 4-7).

## More Men in Sheltered Homeless Families

The ratio between adults and children in sheltered homeless families changed very little over the 2007-2009 time period. However, adults in families were somewhat more likely to be men in 2009 than they were in 2007, 20.4 percent vs. 18.0 percent, as shown in Exhibit 4-8. This probably accounts for the slight increases in the percentages of 3 and 4 person households shown on the exhibit, despite the lack of change in the percentage of people in sheltered homeless families who are children. Because of the recession, more families with two adults may have become homeless, as well as more families with only a father present.

Providers in six of the nine communities visited for this report said they had seen an increase in two-parent families and male-headed families. Providers generally attribute the increase in two-parent families to the effects of the recession, which is making it difficult for even one parent to find a job. According to one provider in Monterey, California, two-parent households now represent about half of all families seeking shelter. Located on the ocean, Monterey has very high housing costs and in recent years has lost affordable rental housing due to foreclosures. According to this provider, "You can't afford to make the rent working at Starbucks." Providers in northeast Iowa also commented on the increase in two-parent households seeking shelter, which they attribute to the lingering effects of the closure of a major manufacturing plant a couple of years ago.

Providers had fewer explanations for the increase in male-headed families. Providers in Detroit suggested that it could reflect higher rates of drug abuse or incarceration among women, or be related to local efforts to encourage men to take a greater role in raising their children.

Providers in several communities noted that it can be harder for male-headed and two-parent families to access shelter, because most facilities are geared toward serving single women and their children.

Exhibit 4-8: Changes in the Composition of Sheltered Homeless Families, 2007$2009{ }^{\text {a }}$

| Characteristic | Percentage of Sheltered Homeless Persons in Families 2007 | Percentage of Sheltered Homeless Persons in Families 2008 | Percentage of Sheltered Homeless Persons in Families 2009 |

### 4.2 Changing Patterns of Becoming Homeless, 2007-2009

The pathways through which people entered shelters or transitional housing changed to some extent between 2008 and 2009. Exhibits 4-9 and 4-10 show the trends over the 2007 through 2009 period separately for sheltered homeless individuals (Exhibit 4-9) and for adults in homeless families (Exhibit 4-10).

## Sheltered Homeless Individuals

People in emergency shelter or transitional housing as individuals were more likely to have come from a place not meant for human habitation in 2009 than was the case in 2007 or 2008, as shown on Exhibit 4-9. According to Continuum of Care point-in-time counts, the number of unsheltered individuals dropped between 2008 and 2009 (see chapter 2). Therefore, the increase of about 31,000 in the number of individuals coming into the shelter system from the "street" between 2008 and 2009 may reflect the success of the homeless services system in reducing unsheltered homelessness rather than a growth in street homelessness.

Overall, the share of homeless individuals coming into shelter from some type of housing (their own housing unit or someone else's) was essentially unchanged over the three-year period, but the share coming from their own housing unit went down slightly, while the percentage who had been staying with friends or family increased from 24.3 percent in 2007 to 25.8 percent in 2008 and 26.8 percent in 2009.

Source: Homeless Management Information System data, 2007-2009
A growing number of people homeless in shelters or transitional housing as individuals came there from substance abuse or detoxification centers over the three-year period. As shown on Exhibit 4-9, the percentage of homeless individuals coming into shelter from that type of institutional setting grew from 3.6 percent in 2007 to 5.3 percent in 2009. In 2009, the number was 48,645 , compared with 27,131 in 2007.

As part of the site visits conducted for this report, providers of homeless services in several communities reported that some individuals exhibited mental health problems of greater severity than in previous years This could be interpreted as a success in reaching the most needy unsheltered people or, alternatively, could reflect budget-related declines in mental health services reaching unsheltered homeless people. Many state and local governments have made significant cuts to social services as a result of budget shortfalls. Providers in several of the communities visited described the impact of those cuts on the size and nature of the homeless populations they serve.

## State Funding Cuts and Homelessness

In California, the state fiscal crisis has led to sharp decreases in mental health funding and a lack of discharge planning from state institutions, as well as what one San Francisco provider described as an "erosion of community resources." In 2007, funding was eliminated for the state's Integrated Services for Homeless Adults with Serious Mental Illness program, and in 2009, the state faced a $\$ 42$ billion budget gap resulting in cutbacks in many social services usually provided at the county level. According to providers, these reductions have limited provision of services to those with the most severe cases of mental illness. Others with only slightly less severe illness cannot be served and end up in the homeless system. As a result, homeless service providers indicated a much higher proportion of their population is afflicted with mental illness. San Francisco providers note that, although they have not seen a substantial increase in the homeless population overall, those they are serving have greater needs.

Providers in Phoenix and Maricopa County told a similar story. The recession has resulted in fewer state and local government resources for safety net services; particularly behavioral health services. In 2009, the City of Phoenix reduced the number of human service one-stop service centers from five to three. The State of Arizona cut Medicaid-funded drug treatment services, and the result has been longer lengths of stay in treatment and fewer available slots opening up for new clients to enter treatment. Many of those who are unable to enter treatment are homeless and remain in the homeless system.

## Sheltered Homeless Persons in Families

There were few changes in the prior living arrangements of persons in families between 2007 and 2009 (Exhibit 4-10). Perhaps the most interesting finding is that the percentages coming from housing units they owned or rented were very little different in 2009 than they were in 2008. The effect of the foreclosure crisis on homelessness seems to be mainly indirect, reflected by the increase in the percentage of families that had been staying with relatives before they became homeless. The change between 2008 and 2009 in the number who said they had been staying with family before becoming homeless was about 9,500, and the three-year change between 2007 and 2009 was 27,330.

Families were less likely to report that they were already homeless when they entered an emergency shelter or transitional housing program in 2009 than they were in 2007, suggesting that much of the increase in family homelessness in recent years has been for families becoming homeless for the first time.

A slightly higher percentage of adults in families said that they had been in substance abuse treatment centers in 2009 compared with 2008. A slightly lower percentage reported that they had been living unsubsidized in a hotel or motel, continuing a pattern of decline in the use of this type of living arrangement by families at risk of homelessness also observed between 2007 and 2008.

### 4.3 Changing Use of the Residential System for Homeless People, 2007-2009

All of the increase in family homelessness in 2009 compared with 2008 was in the use of emergency shelters by family members, rather than transitional housing. Exhibit $4-11$ shows the number of persons in families using only emergency shelter, only transitional housing, or both programs during the course of a year. The number of persons in families staying just in emergency shelters grew by more than 20,000 people, while the numbers using transitional housing alone or in combination with emergency shelter dropped slightly. This pattern may reflect efforts by communities to help families move quickly to permanent housing rather than using a transitional housing program first. Also, it could reflect a shift in the types of families becoming homeless, with a smaller number needing the additional stabilizing services offered by transitional housing programs. Adult family members who reported that they had a disability dropped from 18.4 percent in 2008 to 14.0 percent in 2009 , consistent with the idea that the growth in family homelessness over the two-year period was driven by economic factors.

## Changes in Lengths of Stay in the Homeless Services System

Exhibit 4-12 shows median lengths of stay in emergency shelter and transitional housing separately for individuals and persons in families. The median number of nights in emergency shelter increased from 14 to 18 for individuals from 2007 to 2008 and then dropped back to 17 nights in 2009. In contrast, the median number of nights in emergency shelter for persons in families was 30 in both 2007 and 2008 and then increased to 36 nights in 2009. Not only did family homelessness continue to increase between 2008 and 2009, it also seems to have become more severe in the sense that it took the typical family longer to leave shelter.

The differing patterns for individuals and family members hold for lengths of stay in transitional housing as well, with the median number of nights for individuals remaining constant between 2008 and 2009 but growing for persons in families, from 161 nights in 2008 to 174 nights in 2009. Growing lengths of stay for families in transitional housing are more difficult to interpret. Six months may be an appropriate stay in transitional housing for families that need the intensive services that transitional housing programs are supposed to provide.

Source: Homeless Management Information System data, 2007-2009

In 2009 as in previous years, many people homeless as individuals spent a week or less in emergency shelter over the course of a year. That percentage dropped from 42 percent in 2007 to 37 percent in 2008, but then remained almost the same ( 38 percent) in 2009, as shown on Exhibit 4-13. The percentage of homeless individuals spending between one and six months in emergency shelter rose from 26 percent in 2007 to almost 30 percent in 2008 and then stayed about the same between 2008 and 2009.

Source: Homeless Management Information System data, 2007-2009

Exhibit 4-14 focuses on those individuals who stayed in emergency shelter for six months or more during a year, a group that made up less than 5 percent of all individuals using emergency shelters in 2009. The comparison of the demographic characteristics of these "heavy users" of the shelter system across the three years-2007, 2008, and 2009-show a steady increase in the percentage of non-minority individuals (white and not Hispanic). This change may be related to bringing more non-minority individuals off the streets and into shelters. (The increasing percentage of heavy users of emergency shelter identifying themselves as belonging to "other" racial groups mainly reflects the growing tendency of people to identify themselves as belonging to several races.)

Exhibit 4-14 shows a dramatic increase in the percentage of heavy users of emergency shelter who are individuals older than 50 years of age, from 30.6 percent in 2008 to 40.5 percent in 2009. This is consistent with other information on the aging of a cohort of individuals that began to exhibit patterns of chronic homelessness in the 1980s. ${ }^{35}$ The percentage of heavy users with a disability dropped slightly, but this may simply reflect more precise estimates resulting from the lower rate of missing data on disability in 2009 than in 2008.

Source: Homeless Management Information System data, 2007-2009

Families are much less likely than individuals to stay in emergency shelter for a week or less. The percentage doing so stayed essentially the same over the three-year period, between 23 and 24 percent. As shown in Exhibit 4-15, the increase in median lengths of stay for families in shelter between 2008 and 2009 resulted mainly from more persons in families spending between two and six months in shelter.

[^20]

Source: Homeless Management Information System data, 2007-2009

Just as is the case for individuals, the percentage of people staying in emergency shelter as families for more than six months of a year who are not members of minority groups increased steadily over the three-year period, from less than 7 percent in 2007 to almost 12 percent in 2009. Long stayers still were more likely to be African American than all sheltered homeless families in 2009, 68.8 percent vs. 47.9 percent (see Exhibit 4-16).

Source: Homeless Management Information System data, 2007-2009

### 4.4 Summary of Trends in Sheltered Homelessness between 2007 and 2009

The major changes that occurred in sheltered homelessness that occurred between 2007 and 2009 were:

- A small overall decline in the number of sheltered homeless people between 2008 and 2009. About 35,000 fewer people were homeless at some time during 2009 than during 2008.
- A 7 percent drop in the number of people homeless as individuals across the three-year period between 2007 and 2009. About 80,000 fewer people were in emergency shelter or transitional housing as individuals in 2009 compared to 2007. This may reflect community success in getting people out of shelters and into permanent housing.
- A continued increase in family homelessness between 2008 and 2009, following a larger increase between 2007 and 2008. In 2009, more than 170,000 families (including more than 535,000 people) were in shelters or transitional housing, a 30 percent increase over the 2007 number of sheltered homeless families. The sustained high level of family homelessness in 2009 reflects the ongoing effect of the recession.
- A slight aging of the adult homeless population, consistent with other research that points to the aging of a cohort of people who became susceptible to homelessness when they were younger.
- A steady decrease (from a high starting point) in the percentage of sheltered homeless families and individuals identifying themselves as African American.
- A slight increase (from a low starting point) in men who are homeless as part of families.
- An increase between 2008 and 2009 in the percentage of individuals reporting that their previous living arrangement was a place not meant for human habitation. Communities may be having some success in getting people off the "street" and into shelters.
- A continued increase between 2008 and 2009 in the percentage of adults in families who reported that they had been staying with family before becoming homeless. However, there was no further increase between 2008 and 2009 in the percentage who said they came from an owned or rented housing unit. The effect of the continuing foreclosure crisis on family homelessness seems to be indirect, as families stay with friends or relatives before entering shelters.
- An increase in the use of emergency shelters by families, and a slight decrease in the use of transitional housing.
- An increase in the median number of nights that family members stayed in emergency shelter, from 30 nights in 2008 to 36 nights in 2009. Family homelessness both increased between 2008 and 2009 and became more severe in the sense that it
took the typical family longer to leave shelter. Looking ahead to the 2010 AHAR, it is possible that lengths of stay will go down as a result of the use of HPRP funds for rapid re-housing.

## Chapter 5

## The Nationwide Capacity of Residential Programs for Homeless People

This chapter describes the nation's capacity to provide shelter or permanent supportive housing for homeless and formerly homeless people. The inventory of beds is reported for four types of residential programs: emergency shelters, transitional housing, permanent supportive housing, and safe havens. The chapter presents information on:

- The 2009 inventory of beds by residential program type, by whether the beds are for individuals or persons in families, and by specific homeless subpopulations: unaccompanied youth, veterans, and victims of domestic violence.
- The geographic location of beds in 2009, focusing on the total number of beds by state and the proportion of beds located in urban and suburban or rural areas.
- The frequency of bed use (or the bed utilization rate) for emergency shelters and transitional housing programs in 2009.
- Changes in the nation's capacity to provide shelter or permanent supportive housing for homeless and formerly homeless persons from 2006 to 2009.

With one exception, all of the information presented in this chapter was reported by CoCs in a bed inventory that is part of their annual application for funding. The bed utilization and turnover rates use the HMIS-based data on the number of shelter users and beds.

## Types of Residential Programs

1. Emergency Shelter: A facility with the primary purpose of providing temporary shelter for people who otherwise would be forced to stay in a place not fit for human habitation.
2. Transitional Housing: A residential program intended to facilitate the movement of homeless people into permanent housing. Homeless people may live in transitional housing for up to 24 months and receive services that prepare them to obtain and retain permanent housing.
3. Safe Havens: A form of supportive housing that serves hard-to-reach homeless people with severe mental illnesses who are on the streets and have been unable or unwilling to participate in supportive services.
4. Permanent Supportive Housing (PSH): Long-term, subsidized housing with supportive services for formerly homeless people with disabilities to enable them to live as independently as possible in a permanent setting.

### 5.1 Inventory of Residential Programs and Beds, 2009

## Total Number of Residential Programs and Beds

In 2009, the nation's capacity to house homeless and formerly homeless people included an estimated 20,065 residential programs and 643,423 year-round beds ${ }^{36}$ (see Exhibit 5-1). The number of beds is divided almost evenly among emergency shelters, transitional housing, and permanent supportive housing, but-for the first time-the number of permanent supportive housing beds is larger than each of the other types of beds.

| Exhibit 5-1: National Inventory of Residential Programs and Year-Round Beds, <br> 2009 $^{\mathrm{a}}$ |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
|  | Programs |  | Beds |  |
|  | Number | Percentage | Number | Percentage |

| Transitional Housing | 7,229 | $36.0 \%$ | 207,589 | $32.3 \%$ |
| Permanent Supportive Housing | 6,701 | $33.4 \%$ | 219,381 | $34.1 \%$ |
| Safe Haven | 126 | $0.6 \%$ | 2,028 | $0.3 \%$ |
| Total Number $^{\mathbf{b}}$ | $\mathbf{2 0 , 0 6 5}$ | $\mathbf{1 0 0 \%}$ | $\mathbf{6 4 3 , 4 2 3}$ | $\mathbf{1 0 0 \%}$ |

${ }^{\text {a }}$ Year-round beds are available for use throughout the year and are considered part of the stable inventory of beds for homeless persons. The inventory includes beds in Puerto Rico, the U.S. Territories of Guam and the Virgin Islands.
b The 2009 inventory includes beds that were reported by CoCs as part of their current and new inventories. The current inventory was available for occupancy on or before January 31, 2008. The new inventory was available for occupancy between February 1, 2008 and January 30, 2009.

Source: 2009 Continuum of Care Application: Exhibit 1, CoC Housing Inventory

## Emergency Shelter and Transitional Housing

In 2009, the national inventory of year-round beds for homeless persons was split almost evenly between emergency shelter and transitional housing programs. However, whereas emergency shelters dedicated slightly more than half of their beds to homeless individuals, transitional housing programs dedicated slightly more than half of their beds to homeless families (see Exhibit 5-2). Family beds are located within units-such as apartments or single rooms that are occupied by one family. Programs that served families had 67,083 family units with an average 3.2 beds per unit.

In addition to their year-round beds, CoCs must report their inventories of seasonal beds and overflow or voucher beds. These beds are exclusively for emergency shelter and are typically used during inclement weather conditions. The 2009 national bed inventory had 20,419 seasonal beds and 30,565 overflow or voucher beds. (See Text Box: Types of Beds

[^21]Reported in a CoC Housing Inventory.) Adding these beds to the total number of year-round shelter beds in emergency shelters and transitional housing programs increases the nation's peak bed capacity for homeless persons by 12 percent, to 475,026 beds. Including these beds also increases the average size of emergency shelters from 36 beds per program to just over 44 beds per program. Considering the short-term and more congregate housing settings of emergency shelters compared to transitional housing, it is not surprising that bed capacity per program is much larger than the approximately 29 beds per program in transitional housing.

## Types of Beds Reported in a CoC Housing Inventory

1. Year-round beds: Beds available for use throughout the year and considered part of the stable inventory of beds for homeless persons.
2. Seasonal beds: Beds usually available during particularly high-demand seasons (e.g., winter months in northern regions and summer months in southern regions), but not available throughout the year.
3. Overflow beds: Beds typically used during emergencies (e.g., a sudden drop in temperature or a natural disaster that displaces residents). Their availability is sporadic.
4. Voucher beds: Beds made available, usually in a hotel or motel. They often function as overflow beds. Some communities, especially rural communities, use vouchers instead of fixed shelters, and thus these beds also can also be year-round beds.
5. Family units: Housing units (e.g., apartments) that serve homeless families. Each family unit includes several beds.

## Safe Havens

HUD funds safe haven programs designed to serve people with severe mental illness. Safe haven programs resemble permanent housing in that homeless individuals may stay in these 24-hour residences for an unspecified duration in private or semi-private accommodations. Safe havens are designed to stabilize a person's housing situation so that his mental health issues can be treated and he can obtain permanent housing. Occupancy in safe havens is limited to no more than 25 people and the average is just under 17 beds per program.

In 2009, 126 safe haven programs containing 2,028 beds made up less than one-half percent of the total bed inventory for serving homeless people.

## Permanent Supportive Housing

For several years, one of HUD's policy priorities has been the development of permanent supportive housing programs that provide a combination of housing and supportive services to formerly homeless people with disabilities. In 2009, the nation's permanent supportive housing inventory included more than 219,000 beds, more beds than in either emergency shelters or transitional housing (Exhibit 5-2). The large number of permanent supportive housing beds reflects the continuing efforts by HUD and communities to end homelessness among chronically
homeless people. About 60 percent of these beds $(131,663)$ served unaccompanied individuals, and the remaining 40 percent served families $(87,718)$. The inventory of permanent supportive housing beds for families was distributed across approximately 31,000 family units, with an average of 2.9 beds per unit. The average size of a permanent supportive housing program is almost 33 beds, in between the size of emergency shelters and transitional housing.
Exhibit 5-2: Number of Beds and Units in Homeless Assistance System
Nationwide, 2009 Year-Round Beds

Source: 2009 Continuum of Care Application: Exhibit 1, CoC Housing Inventory

## Inventory of Beds for Homeless Subpopulations

Emergency shelter and transitional housing programs reserve a portion of their beds for a variety of homeless subpopulations with special characteristics and needs. In 2009 , about 82 percent of beds were available to the general homeless population, with the remainder of beds reserved for specific subpopulations: approximately 13 percent for victims of domestic violence; 3 percent for veterans; 2 percent for unaccompanied youth; and almost 1.5 percent for persons living with HIV/AIDS (Exhibit 5-3). ${ }^{37}$

While both emergency shelters and transitional housing programs target about one-fifth of their beds to specific populations, the target population varies slightly by program type. A larger proportion of beds were available for victims of domestic violence in emergency shelters (16 percent) than in transitional housing ( 9 percent). Transitional housing programs reserved more beds for veterans ( 5 percent) and for persons living with HIV/AIDS ( 2 percent), compared to

[^22]emergency shelters ( 0.8 percent for both population types). The share of beds for unaccompanied youth was the same for both emergency shelters and transitional housing programs (2 percent).

### 5.2 Geographic Location of Beds, 2009

## Distribution of Beds by State

Exhibit 5-4 shows the total number of beds by state. The exhibit also provides the number of beds per 1,000 people in the state. In 2009, there were 2.0 beds for homeless and formerly homeless persons for every 1,000 people in the United States.

With 17.1 beds per 1,000 persons, the District of Columbia has three times higher a ratio of beds to persons as the highest state, New York, which has a ratio of 4.8 beds per 1,000 persons. New York also has the largest inventory of beds in the country, with approximately 94,500 beds, followed by California with 88,688 . No other state has more than 32,000 beds, and New York and California combined have 29 percent of the nation's bed capacity. Wyoming has the fewest beds of any state ( 835 beds), but Mississippi has the fewest beds per 1,000 persons ( 0.6 ). Kansas is the only other state with less than 1 bed per 1,000 persons.

## Distribution of Beds by Urban and Suburban or Rural Areas

According to information submitted by CoCs in 2009, more than half of all programs and almost two-thirds of all beds are located in a principal city (Exhibit 5-5). The distribution of programs and beds varies by program type. Transitional housing and permanent supportive housing programs follow a similar distribution as the inventory of beds. In contrast, while 70 percent of emergency shelter beds are located in principal cities, less than half of the programs are located in these areas because emergency shelter programs tend to be larger in principal cities than in suburban and rural areas. The average size of an emergency shelter in principal cities was 53 beds, compared to 20 beds in suburban and rural areas.

### 5.3 Bed Utilization and Turnover Rates, 2009

This section describes the average daily bed utilization and bed turnover rates by residential program type and geographic area. The bed utilization and turnover rates use one-year estimates of shelter users based on HMIS data together with bed inventory information reported by CoCs in their annual applications. The HMIS data provide information on the total number of people who used an emergency shelter or transitional housing facility at any point from October 1, 2008 through September 30, 2009.

## Emergency Shelters

Between October 2008 and September 2009, almost 89 percent of emergency shelter beds were occupied on an average day (Exhibit 5-6). Emergency shelter beds dedicated to individuals had a slightly higher utilization rate than beds for persons in families. Turnover rates were much higher for beds used by individuals than by persons in families. Eight homeless people per year were served in beds for individuals compared with 4.7 people per bed for persons in families. This is consistent with the longer lengths of stay for families in emergency shelters compared to individuals reported in chapter 3.

## Types of Bed Utilization Rates

1. Average daily utilization rate: The percentage of available year-round equivalent beds occupied on an average night during the 12-month reporting period. Year-round equivalent beds include seasonal beds that have been pro-rated for the portion of the year that they are available. Vouchers have been pro-rated based on the bed nights paid for with vouchers during the year.
2. Turnover rate: The total number of people served per year-round bed during the 12-month reporting period.

Emergency shelters located in suburban and rural areas have a higher utilization rate than shelters in principal cities, especially for homeless individuals: 95 percent of emergency shelters beds for individuals in suburban or rural areas were occupied on an average night, compared to 88 percent of these beds in principal cities. Suburban and rural area shelters also had higher turnover rates for individual and family beds than their counterparts in principal cities.

| Exhibit 5-6: | $\begin{array}{l}\text { Average Daily Utilization and Turnover Rate of Year-Round Equivalent } \\ \text { Beds by Program and Household Type and Geographic Area, } 2009\end{array}$ |
| :--- | :--- |

| Rate ${ }^{\text {a }}$ | Emergency Shelters |  |  | Transitional Housing |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Total | Individual | Family | Total | Individual | Family |
| Overall |  |  |  |  |  |  |
| Utilization rate | 88.5\% | 89.9\% | 86.7\% | 82.4\% | 82.5\% | 82.3\% |
| Turnover rate | 6.5 | 8.1 | 4.7 | 1.8 | 2.1 | 1.6 |
| Principal City |  |  |  |  |  |  |
| Utilization rate | 87.9\% | 88.2\% | 87.5\% | 82.7\% | 82.6\% | 82.9\% |
| Turnover rate | 6.5 | 7.9 | 4.5 | 1.9 | 2.1 | 1.7 |
| Suburban and Rural Areas |  |  |  |  |  |  |
| Utilization rate | 90.0\% | 95.3\% | 85.2\% | 82.0\% | 82.3\% | 81.7\% |
| Turnover rate | 6.7 | 8.6 | 5.1 | 1.7 | 2.0 | 1.5 |

${ }^{\mathrm{a}}$ The rates reported in the exhibit are based on year-round equivalent beds. A year-round equivalent bed is equal to the total number of year-round beds plus the total number of seasonal beds in proportion to the amount of time these beds were available plus the total number of vouchers in proportion to how many "voucher beds" were used during the one-year reporting period.
b The exhibit provides two types of bed utilization rates-average daily bed utilization rates and bed turnover rates. The average daily bed utilization rate is calculated by dividing the average daily census during the study period by the total number of year-round beds in the current inventory and then converting it to a percentage. The turnover rate measures the number of persons served per available bed over the 12-month period. It is calculated by dividing the number of persons served by the number of year-round beds.

Source: Homeless Management Information System data, 2009

## Transitional Housing

Compared to emergency shelters, transitional housing programs have lower bed utilization and turnover rates. About 82 percent of transitional housing beds were occupied on an average day, and this did not vary much by whether the beds were dedicated to individuals or families or by the location of the beds. Not surprisingly, bed turnover rates in transitional housing were much lower than those of emergency shelters. Transitional housing programs are designed to serve people for up to two years. During the one-year reporting period, a transitional housing bed typically serves a little less than two people.

These data reinforce two patterns that have been observed consistently in other studies: (1) emergency shelters have higher average daily utilization rates and turnover rates than transitional housing programs, and (2) beds for unaccompanied individuals have higher average daily utilization rates and turnover rates than beds for persons in families. ${ }^{38}$ Duration in a shelter and frequency of bed use both affect turnover rates. The shorter the average length of stay and the faster a program can fill a vacant bed, the higher the turnover rate. These findings also are consistent with the information reported in chapter 3, which shows that people who stay in emergency shelters have shorter lengths of stay than those who stay in transitional housing programs, and that individuals who stay in either program type have shorter lengths of stay than families in the same program type.

### 5.4 Changes in the National Inventory and Utilization of Beds, 20062009

## Changes in the Total Number of Beds

From 2006 to 2009, the total number of beds available in residential programs throughout the United States increased by almost 60,000 beds (or 10 percent), reflecting an increase in beds across all program types (Exhibit 5-7). The number of emergency shelter beds increased by 7,548 ( 3.6 percent), the number of transitional housing beds increased by 7,880 ( 3.9 percent), and the number of permanent supportive housing beds increased by more than both other programs combined by 42,551 (24.1 percent). More than half the growth in permanent supportive housing beds occurred in the last year, from just under 196,000 in 2008 to more than 219,000 in 2009. In the same one-year period, the number of permanent supportive housing programs grew by 555 , to 6,701 in 2009.

The increase in the inventory of permanent supportive housing programs and beds is particularly noteworthy because it is consistent with HUD's emphasis on expanding the stock of supportive housing. In collaboration with the Interagency Council on Homelessness, HUD has placed

[^24]federal policy and funding behind local efforts to end homelessness through permanent supportive housing. Hundreds of city governments have responded by developing " 10 year plans" that place a priority on expanding permanent supportive housing in their communities. HUD has also partnered with the Department of Veterans Affairs to administer jointly a new federal Veterans Affairs Supportive Housing (VASH) program. The HUD-VASH program combines rental assistance for homeless veterans with case management and clinical services provided by the Department of Veterans Affairs at its medical centers and in the community.

As reported in Chapter 2, the number of persons who were chronically homeless decreased substantially from 2006 to 2009. During the same time period, over 42,000 permanent supportive housing beds were added to the nation's inventory. These findings suggest that HUD's efforts to move chronically homeless people off the streets or other places not meant for human habitation and into permanent housing are starting to pay off.

Source: Homeless Management Information System data, 2007-2009

## Changes in the Inventory of Beds for Homeless Subpopulations

The overall proportion of beds dedicated to homeless individuals and persons in families has remained fairly constant since 2006. The percentage of emergency shelter beds dedicated to homeless persons in families has increased slightly, from 46 to 48 percent, and also in transitional housing, from 52 to 53 percent (Exhibit 5-8). In contrast, the percentage of permanent supportive housing beds for families has decreased since 2006, from 44 percent to 40 percent in 2009, likely
reflecting the increased number of new units resulting from an emphasis on ending chronic homelessness through permanent supportive housing programs. By definition, all chronically homeless persons are individuals.

## Changes in Average Daily Utilization and Turnover Rates

The average daily utilization rate for emergency housing in 2009 returned to the 2007 level of 88.5 percent after an increase in 2008. The utilization rate in transitional housing increased between 2007 and 2008 and maintained the higher rate in 2009 ( 82.4 percent). The bed turnover rate remained constant during this period for transitional housing, suggesting that the increased utilization rate is being driven by retaining the clients longer rather than serving more clients per bed over the year.

Changes in bed utilization patterns varied depending on the geographic location of programs and beds. In emergency shelters, the utilization rate in principal cities increased by about five percentage points between 2007 and 2008, but decreased by about four percentage points in suburban and rural areas. By 2009, both types of geographic locations had nearly returned to the rate in 2007. In transitional housing, the utilization rate in principal cities increased steadily between 2007 and 2009, from 78.6 to 82.7 percent. The utilization rate in suburban or rural areas increased considerably from 2007 to 2008 (about 10 percentage points), and then stabilized in 2009 , to 82 percent.

${ }^{\text {a }}$ The rates reported in the exhibit were based on year-round equivalent beds. A year-round equivalent bed is equal to the total number of year-round beds plus the total number of seasonal beds in proportion to the amount of time these beds were available during the one-year reporting period.
${ }^{\mathrm{b}}$ The exhibit provides two types of bed utilization rates-average daily bed utilization rates and bed turnover rates. The average daily bed utilization rate is calculated by dividing the average daily census during the study period by the total number of year-round beds in the current inventory and then converting it to a percentage. The turnover rate measures the number of persons served per available bed over the 12 -month period. It is calculated by dividing the number of persons served by the number of year-round beds.
Source: Homeless Management Information System data, 2006-2009

### 5.5 Summary of the Nationwide Capacity of Residential Programs for Homeless People

The number of emergency shelter and transitional housing beds for serving homeless people increased by nearly 15,000 beds between 2006 and 2009. The added supply has not gone unused: almost 90 percent of emergency shelter beds are filled on an average night, as are about 82 percent of transitional housing beds. The number of permanent supportive housing beds for serving formerly homeless person has grown even more rapidly, increasing by 24 percent since 2006. There are now more permanent supportive housing beds than either emergency shelter or transitional housing beds.

The bed inventory data reported by CoCs show that:

- The 2009 national inventory of residential programs and year-round beds serving homeless and formerly homeless people included an estimated 20,065 residential programs and an estimated 643,423 beds.
- The 2009 national bed inventory included 20,065 seasonal beds and 30,565 overflow or voucher beds. If these beds are added to the total number of year-round shelter beds in emergency shelters and transitional housing programs, the nation's peak capacity for homeless persons in 2009 was 475,026 beds.
- Between 2006 and 2009, the total number of beds available in residential programs throughout the United States increased by approximately 60,000 (10 percent), reflecting an increase in beds across all program types.
- The increase in permanent supportive housing beds (about 43,000 ) accounts for twothirds of the increase in beds for homeless and formerly homeless people between 2006 and 2009.
- Between 2008 and 2009, the average daily bed utilization rate remained constant in transitional housing 82 percent), but returned to the 2007 level in emergency shelters (89 percent).

## Chapter 6 Looking Ahead

This report builds on last year's report by adding data on sheltered homeless people for another full year, allowing for a comparative analysis of homelessness that spans three years-2007, 2008, and 2009. The inclusion of data for a third year is important because it marks the establishment of discernable trends in homelessness. This report is also the first to include information from in-person interviews with local service providers located in nine communities nationwide. The qualitative information provides a contextual backdrop for understanding how homelessness is changing throughout the nation. Finally, the report adds Point-in-Time (PIT) counts of sheltered and unsheltered persons and of homeless subpopulations for another year, providing trend data for 2006 through 2009.

The trends observed in this AHAR reinforce some of the findings from previous reports. Homelessness remains predominately an urban phenomenon, and most people are homeless as individuals rather than as members of families. But trends reported in this 2009 AHAR also provide an indication of how homelessness may be changing over time and whether the current economic and foreclosure crisis has led to higher rates of homelessness. Overall, the number of sheltered homeless persons has remained relatively unchanged between 2007 and 2009, at about 1.6 million people over the course of each year, but the composition of the sheltered homeless population has shifted. During the three-year period, the number of sheltered persons in families increased by 13 percent, and families now represent more than one-third of the entire sheltered population, up from 29 percent in 2007. From 2007 to 2008, the share of the overall sheltered homeless population living in suburban and rural areas increased from 23 percent to 32 percent. From 2008 to 2009, even though the share of the sheltered homeless population in suburban and rural areas remained at 32 percent, the number of sheltered persons in families still increased by nearly 4 percent in suburban and rural areas.

So far, both the PIT and HMIS-based estimates of homeless people do not suggest that the economic recession has created a surge in homelessness, but signs of the recession's impact are present. The continued growth in sheltered family homelessness almost certainly reflects the ongoing effect of the recession. Also, because of the recession, more families with two adults may have become homeless, as well as more families with only a father present. But the long-term effects of the recession are unclear. Many families are doubling up in response to the economic downturn, and data in the 2009 AHAR reinforce this point. Between 2007 and 2008, as well as between 2008 and 2009, there was an increase in the share of people coming to shelters who were living with family or friends the night before entering a homeless residential facility. If some of these family support networks already are struggling to make ends meet, some of the doubled-up families may find their way into the homeless residential service system during 2010. On the other hand, as the nation comes out of the
recession, and as the stimulus funding made available through the Homelessness Prevention and Re-housing Program (HPRP) starts helping families in crisis avoid shelter, it also is possible that family homelessness will decline over the coming months. Thus, the fortunes of many families who were affected by the recession may still be in the balance.

The 2009 AHAR is the first to include a companion report on homeless veterans, which will be published later in 2010. The report on homeless veterans comes at a time when many service men and women are returning from active duty in Iraq and being deployed to Afghanistan. This report will provide an important baseline understanding of homelessness among veterans that, in turn, can be used to assess how homelessness among veterans may change over time.

### 6.1 The 2010 AHAR

The 2010 AHAR will continue to provide Congress and the nation with updated counts of homelessness nationwide, including counts of individuals, persons in families, and special population groups such as chronically homeless people and persons with disabilities. These topics will be explored using data from an ever-expanding group of communities that participate in the AHAR, which now includes the majority of Continuums of Care nationwide. The 2010 AHAR also will add another full-year of HMIS data to further highlight trends in homelessness and identify any long-term impacts of the economic recession.

The 2010 AHAR will be the first to include data on people served in permanent supportive housing programs, in addition to the data from emergency shelter and transitional housing programs that have constituted the first five AHARs. The slight decrease in the number of people using transitional housing programs in 2009 may have been a result of communities moving families directly from emergency shelters to permanent supportive housing. The 2010 AHAR will be able to assess this question, among many others, in a more nuanced fashion. The 2010 AHAR will also be the first to examine trends in homelessness among veterans, comparing the 2009 supplemental report on homeless veterans (to be released later in 2010) with the 2010 supplemental report.

HUD continues to view the AHAR as the primary resource for up-to-date information about homelessness based on locally-derived HMIS data and is exploring ways to make these data readily accessible to states, localities, and the general public. Based on the AHAR, policymakers and practitioners alike will be able to better understand homelessness in their communities, allocate local homeless assistance funds effectively, improve program operations, and work toward the ultimate goal of ending homelessness.

1 A commmunity designated as a "complete zero provider" does not have any emergency shelters or transitional housing programs located in their jurisidiciton.

* Indicates a zero-provider reporting category, meaning that the community does not have any programs in the category.

## Appendix B:

## Data Collection and Analysis Methodology

## Appendix B

## Data Collection and Analysis Methodology

## B. 1 Introduction

This document summarizes the methodology for producing the 2009 Annual Homeless Assessment Report (AHAR). Abt Associates and the University of Pennsylvania Center for Mental Health Policy and Services Research (the AHAR research team) developed the methodology.

The 2009 AHAR is based on two primary sources of data:

1. Homeless Management Information Systems (HMIS). The HMIS data were collected from a nationally representative sample of communities ${ }^{1}$ and cover a one-year reporting period, October 1, 2008 to September 30, 2009. The data contain information on homeless persons who used emergency shelters or transitional housing at any point during this time period. Data are unduplicated at the community-level and reported in the aggregate. HMIS data include information on the number, characteristics, and serviceuse patterns of homeless persons.

Each AHAR incorporates HMIS data for the most recent, one-year reporting period and compares these data to previous findings. The 2009 AHAR provides comparisons of HMIS data from 2007-2008 (first reported in the 2008 AHAR) to data from 2008-2009.
2. Continuum of Care (CoC) applications. The CoC application data were collected from all CoCs in 2009, and the 2009 AHAR compares these data to data from the previous two years. The CoC application data complement the HMIS-based data by including an estimate of the number of unsheltered homeless persons on a single night in January. They also include an estimate of the number and basic demographic characteristics of sheltered homeless persons on that night and the number of emergency shelter and transitional housing beds available to serve homeless persons. The information comes from the CoC applications that all CoCs must complete to be eligible for HUD McKinney-Vento Act funding.

[^25]The remainder of this appendix describes the AHAR sample data in more detail. Section B-2 discusses the population represented by the AHAR sample and the information collected about persons experiencing homelessness. Section B-3 describes how the nationally representative sample was selected and the number of communities that were able to contribute local HMIS data to the AHAR. Section B-4 presents the results of the data cleaning process and describes how usable data were identified for the final AHAR analysis file. Section B-5 describes the process for developing the analysis weights for each site to produce nationally representative estimates.

## B. 2 Data and AHAR Reporting Categories

This section describes the target population for inclusion in the AHAR sample, the source of data, and the data collection process.

## Target Population for the AHAR Sample

The HMIS-based data in the AHAR sample includes information on all persons experiencing homelessness who used an emergency shelter or transitional housing facility at any time during a one-year period, from October 1, 2008 through September 30, 2009.

The sample does not include individuals who are homeless but live in an area not within a Continuum of Care, or individuals who live in a CoC community but do not use an emergency shelter or transitional housing program. However, given that CoCs cover 97 percent of the U.S. population, including all areas thought to face a high rate of homelessness, few homeless persons are likely to live outside CoC communities. The target population also excludes CoCs in Puerto Rico and other U.S. Territories. Hence, the estimates represent the 50 states and the District of Columbia. The unsheltered homeless population-persons who live on the streets or other places not meant for human habitation-is not represented by the HMIS data in the sample if such persons do not use an emergency shelter or transitional housing facility at any time during the one-year data collection period.

One caveat associated with the use of HMIS data for national reporting is that an important subset of homeless service providers is not permitted to participate fully in data collection. The 2005 Violence against Women and Department of Justice Reauthorization Act prohibits "victim service providers" ${ }^{2}$ from entering personally identifying information into an HMIS. Even though CoCs were required to include these programs as part of their housing inventory in their funding application, we excluded their beds from our extrapolations; thus, the

[^26]national estimate of the sheltered homeless population does not include persons using residential "victim service" providers.

## Homeless Management Information System Data

The information on homeless persons in the AHAR sample is based on HMIS data collected by local homeless assistance providers. HMIS are computerized data collection applications operated by CoCs that store data on homeless individuals and families who use homelessness assistance services.

HMIS data have some important features. First, they have been standardized nationally in accordance with HUD's National HMIS Data and Technical Standards Notice (Data Standards). ${ }^{3}$ All HUD McKinney-Vento-funded homeless programs are required to collect 14 universal data elements from every client served. ${ }^{4}$ The Data Standards define each data element. The universal data elements include information on a client's demographic characteristics (e.g., date of birth, ethnicity and race, gender, veteran status, and disability status) and recent residential history (e.g., residence before program entry, program entry and exit dates, and zip code of last permanent address). The data are essential to obtaining an accurate picture of the extent, characteristics, and patterns of service use of the local homeless population.

Second, HMIS data include personally identifying information that allows local communities to produce an accurate de-duplicated count of homeless persons in their communities. For each person served, programs must collect a client's full name and Social Security Number. The personally identifying information may be used in combination with other client-level information to calculate the number of unique users of homeless services and to identify persons who use several types of services.

Third, HMIS data may be manipulated to produce a more comprehensive picture of homelessness when compared to older data collection systems (e.g., paper records). Given that the data are stored electronically in sophisticated software applications, data users may produce cross-tabulations and other outputs that were impractical or impossible before the advent of HMIS. As a result, HMIS data offer new opportunities to study the nature and extent of homelessness.

## AHAR Reporting Categories

To facilitate the AHAR reporting process, the AHAR research team developed five reporting categories that are used to collect information from participating communities. All of the

[^27]information required in the reporting categories is based on the universal data elements specified in the HMIS Data Standards. The five reporting categories are:

1. Individuals served by emergency shelters (ES-IND)
2. Individuals served by transitional housing facilities (TH-IND)
3. Families served by emergency shelters (ES-FAM)
4. Families served by transitional housing facilities (TH-FAM)
5. A summary table

Reporting categories 1 through 4 contain several sections. The first section is an extrapolation worksheet for estimating the total number of individuals or persons in families that used an emergency shelter or transitional housing facility during the data collection period. This section guides the community through a process for estimating the number of individuals or persons in families served by providers participating in HMIS as well as by nonparticipating providers. A limited amount of data from the HMIS and communities' bed inventory is required to complete the extrapolation. The remaining sections in each set of reporting categories are designed to capture information about the homeless population in the community. Each set of reporting categories is designed with embedded codes to check for data errors, such as missing values or inconsistent information. A summary sheet of data errors is automatically generated as communities complete the reporting categories, prompting communities to review and correct any errors.

The final set of reporting categories - the summary tables-is designed to save time and increase data accuracy. The tables provide estimates of the total unduplicated count of persons who used a participating and nonparticipating emergency shelter or transitional housing program in each jurisdiction during the data collection period. The summary tables also show estimates of the demographic characteristics of the service-using population, patterns of program use, and the average daily utilization rate among persons accessing shelters and transitional housing. The summary tables automate many calculations and are designed with embedded data quality checks that list error messages when inconsistent information is entered.

The data submission process is channeled through the AHAR Exchange, a web-based data collection instrument designed specifically for the AHAR. Communities login to the AHAR Exchange using a unique username and password and submit the data by either typing the aggregate data into each reporting category or by uploading all their data via an XML schema into the appropriate reporting category. Each community is assigned a data quality reviewer (a member of the research team) who reviews each submission and works collaboratively with representatives from the community to fix any data quality issues. A public version of the AHAR Exchange is available for viewing and local use: http://sandbox.hmis.info/.

## B. 3 Sample Selection

This section describes the procedures for selecting a nationally representative sample of 102 jurisdictions for the AHAR. ${ }^{5}$

## CDBG Jurisdictions Are Primary Sampling Units

The AHAR uses the geographic areas defined for the allocation of CDBG funds as the primary sampling unit. The four types of CDBG jurisdictions are:

- Principal cities ${ }^{6}$
- Cities with 50,000 or more persons (that are not principal cities)
- Urban counties
- Rural areas or non-entitlement jurisdictions

CDBG jurisdictions constitute the basic building blocks of CoCs. In some cases, the CDBG jurisdiction and the CoC represent the same geographic area (e.g., principal cities are often a single CoC), but, in other situations, the CDBG jurisdiction is a geographic subunit of the CoC (e.g., a small city with 50,000 or more persons may be a subunit of a countywide CoC). The selection of 102 CDBG jurisdictions ensures the inclusion of a wide range of sites in the AHAR as well as the reasonably precise measurement of the characteristics of homeless persons and their patterns of service use.

The U.S. Department of Housing and Urban Development provided a sampling frame for the selection of CDBG jurisdictions. The sampling frame is a list of all 3,142 CDBG

[^28]jurisdictions within the 430 CoCs in the 50 states as of $2002 .^{7}$ The next section describes the decision to stratify the sites based on geographic type, along with the procedures for selecting certainty and non-certainty sites.

## Stratifying the Sample by Type of Geographic Area

A CDBG jurisdiction may be a large principal city of a metropolitan area, a smaller city with a population of 50,000 or more, one or more suburban or urban fringe counties, or a rural area. As such, the number of homeless persons in each jurisdiction varies considerably.

Using the relative size of the homeless population in each CDBG jurisdiction to select a sample may increase the precision of the estimates for any particular sample size. However, with the number of homeless persons in each CDBG jurisdiction unknown, the study team assumed that the total population in each CDBG jurisdiction provided a measure of relative size of the homeless population for purposes of sample selection. The study team premised the assumption on the likelihood that the number of homeless persons is correlated with the total population in the area served by the CDBG jurisdiction. The team further refined the assumption by dividing the sample into strata based on the expected rate of homelessness. ${ }^{8}$

Earlier research on homelessness indicates that the rate of homelessness varies by type of geographic area. For example, Burt (2001) found that 71 percent of the homeless persons using homeless-related services are located in principal cities but that only 30 percent of the total U.S. population lives in principal cities. ${ }^{9}$ By contrast, rural areas account for 9 percent of the homeless population, but 20 percent of the overall population. Further, suburban/urban fringe areas represent 21 percent of homeless persons, but 50 percent of the overall population. These findings suggest that, before using the total population as a proxy

[^29]for the relative size of the homeless population, the CDBG jurisdictions should be stratified by type of geographic area to account for the fact that the ratio of homeless persons to the population varies across geographic areas. Hence, the study team divided the CDBG jurisdictions into four groups based on their classification for the allocation of CDBG funds: principal cities, other cities larger than 50,000, urban counties, and rural areas (i.e., counties that are part of non-entitlement areas). Such stratification increases the precision of estimates.

## Very Large CDBG Jurisdictions Selected with Certainty

Given that the size of the population across CDBG jurisdictions is skewed by a few very large jurisdictions covering areas with several million residents, a useful strategy for reducing sampling variability in the estimated number and characteristics of homeless persons is to select very large jurisdictions in the sample with certainty. Selecting a CDBG jurisdiction with certainty means that the CDBG jurisdiction represents only itself in the sample estimates but ensures that the sample does not exclude the largest jurisdictions, whose number and characteristics of the homeless population could substantially affect national estimates. Exhibit B-1 lists the 18 CDBG jurisdictions selected with certainty.

For selecting the certainty sites, the study team divided the CDBG jurisdictions into the four geographic-type strata. Assuming the rate of homelessness was the same in each area within each stratum, the study team calculated the standard deviation (square root of the variance) of the number of homeless persons for the entire stratum. The team then recalculated the standard deviation by excluding the largest site (as if that site were taken with certainty) to obtain a relative estimate of the reduction in the variance of the estimates that would occur if that site were selected with certainty. In the event of substantial reduction in the variance due to the selection of the certainty unit, the overall variance of the sample estimates will be smaller as the variance contribution to the estimate from the certainty sites is zero. The process of selecting the next-largest site as a certainty site continued until the reduction of the variance or standard deviation was small or marginal. The process resulted in the identification of 11 certainty sites consisting of eight principal cities, one other city larger than 50,000, and two urban counties (but no non-entitlement areas).

Based on earlier research findings showing that homeless persons are disproportionately located in principal cities, the study team identified 7 additional principal cities as certainty sites, for a total of 15 principal cities in the certainty sample (and 18 certainty sites in total). The team selected the 7 additional principal cities with certainty because the cities had among the largest populations of persons living in emergency and transitional shelters in the

1990 and 2000 Census counts. ${ }^{10}$ All 7 certainty sites had one of the 10 largest counts in either 1990 or $2000 .{ }^{11}$ Given that so many homeless persons live in these cities, it is important to include them with certainty in a nationally representative sample.

## Selection of Non-Certainty Sample

There are currently 102 AHAR sample sites. The selection of the non-certainty sites occurred in two phases. Phase one was completed in 2005 and included 62 non-certainty sites. The 62 non-certainty sites and the 18 certainty sites ( 80 total sample sites) constituted the original sample for the 2005, 2006, and 2007 AHARs. Phase 2 was completed for the 2008 AHAR and added 22 non-certainty sites to the original sample.

Phase 1: Selecting 62 Non-Certainty Sites. To select the 62 non-certainty sites for the original sample, the study team divided the 3,124 CDBG jurisdictions into 16 strata based on the four types of geographic areas and Census regions. As discussed earlier, the team divided the sample into strata based on the type of geographic area because earlier research indicated that the rate of homelessness is higher in principal cities than in other areas. The team further divided the sample into Census regions because business cycles might affect regions differently and result in variation in rates of and trends in homelessness across regions. Dividing the sample into strata that are more similar in terms of the rate of homelessness and the characteristics of homeless persons than the overall population reduces the variance of the sample estimates for a particular sample size. Stratified sampling also eliminates the possibility of some undesirable samples. For example, with a simple random sample, one possible sample might include sites only in rural areas or sites only in the Northeast, both of which are undesirable samples.

One possibility considered for the non-certainty sample was allocation of the sample to the stratum in proportion to the population in each stratum. However, such an approach ignores the research indicating that a disproportionate share of the homeless is located in principal cites. Ignoring information on the location of the homeless population would lead to a relatively high degree of imprecision in national estimates such that 20 of the 62 noncertainty sites would be allocated to principal cities, 6 to non- principal cities, 16 to urban counties, and 20 to rural areas. The same number of rural areas as principal cities would be selected even though earlier research suggests that only 9 percent of the homeless population lives in rural areas whereas 70 percent lives in principal cities.

[^30]Another possibility under consideration for the non-certainty sample was allocation of the total non-certainty sample of 62 CDBG jurisdictions to each of the 16 strata in proportion to the adjusted population in each stratum, where the adjustment accounts for different rates of homelessness across geographic areas. This allocation method produces the highest degree of precision of national estimates for a given sample size. The adjusted population is the population of persons living in an area multiplied by an adjustment factor for the expected rate of homelessness in that area. With the rate of homelessness in principal cities roughly five times that of other areas, ${ }^{12}$ the study team multiplied the population in principal cities by five so that the adjusted populations would reflect the relative number of homeless persons expected in each stratum. If the adjusted population were used to allocate the non-certainty sites across the strata, 39 of the 62 original non-certainty sample sites would have been allocated to principal cities, 4 to non- principal cities, 8 to urban counties, and 11 to rural areas. While optimal for national estimates, the number of sites in the non-principal city stratum was too small for subnational estimates.

The sampling allocation procedure ultimately used for AHAR data collection strikes a balance between the most precise national estimates possible with a sample of 62 noncertainty sites and reasonably sized samples from each of the four types of geographic areas. The study team allocated the 62 original non-certainty sample sites across the 16 strata based on the square root of the adjusted population. The result is a sample allocation between the allocation in proportion to the population and the allocation in proportion to the adjusted population. Accordingly, 27 of the 62 original non-certainty sites are in principal cities, 8 are in non-principal cities, 13 are in urban counties, and 14 are in rural areas. The allocation means lower variances of the estimates than either simple random sampling or sampling in direct proportion to the population and provides better representation of non- principal city areas than the allocation in proportion to the adjusted population.

To select the non-certainty sites in each stratum, the study team divided the sites into groups based on size and then randomly selected one site from each group. The number of noncertainty sites allocated to each stratum determined the number of groups, and each group in a stratum contained the same number of sites. Sampling from groups based on population size is beneficial in that it ensures that the sample has a similar distribution of CDBG jurisdiction sizes as the population. Given that the size of the homeless population is expected to correlate with the total population within strata, similarity in distribution is an important feature of the sample.

12 The ratio was determined as follows. Burt (2001) found that 71 percent of the homeless population lived in central cities in 1996. At the same time, Current Population Survey data indicate that only 30 percent of the overall population lived in central cities at that time. The ratio of the share of the homeless population to the share of the overall population in central cities is 2.36 . The ratio is 0.42 for non- principal city portions of Metropolitan Statistical Areas and 0.46 for rural areas. Dividing the principal city ratio by the rural ratio (2.36/0.46) equal 5.1, suggesting that the rate of homelessness is about five times higher in central cities than in rural areas.

Phase 2: Adding 22 Rural Non-Certainty Sites. The data collection results from the 20052007 AHAR reports indicated that many rural communities (or non-entitlement CDBG areas) did not have emergency shelters or transitional housing programs located in these jurisdictions. Among the few rural sample sites that did have emergency shelters and/or transitional housing programs, many of those programs were not entering data into an HMIS. As a result, previous AHAR reports did not capture information from many rural jurisdictions, and the lack of data increased the variance of the AHAR estimates and made the analysis of rural/suburban versus urban homelessness less reliable.

In 2008, 22 new rural communities were added to the AHAR sample, increasing the total number of rural jurisdictions to 36 and the total number of AHAR sample sites to 102. The 22 AHAR sample sites that were added in 2008 were selected in the same manner as the original non-certainty sample sites. The original 2002 sampling frame of 3,142 CDBG jurisdictions within the 430 CoCs in the 50 states was used to select the new rural communities. However, the original file was compared with an updated 2006 CDBG list of jurisdictions to remove from the sampling frame jurisdictions that had either merged with other jurisdictions since 2002 or had changed their status from non-entitlement (rural) areas to entitlement areas.

The sample was stratified to ensure that each of the four census regions was represented. The goal was to select at least three rural communities from each census region that had at least one emergency shelter or transitional housing program. In some cases, more than three communities for a particular region were selected if inventory information reported by CoC suggested that the communities did not have any emergency shelters or transitional housing programs. That is, from each region, we randomly selected rural jurisdictions until we had at least three rural jurisdictions with at least one emergency shelter or transitional housing program. In total, 22 new rural sample sites were added in 2008; three from the Northeast region; seven from the South region; seven from the Midwest region; and five from the West region.

The final AHAR sample contains 102 sample sites, and Exhibit B-2 shows the total number of certainty and non-certainty sites selected from each region-CDBG type stratum. The sample sites contain over 40 million persons, or approximately 16 percent of the population living within CoC communities and 14 percent of the U.S. population. The expectation is that the sample will contain an even higher proportion of the U.S. homeless population because the selection procedures intentionally oversampled areas with a high rate of homelessness (i.e., principal cities). About two-fifths of the selected sites (42 sites) are principal cities, even though only one-third of the total population lives there. The other 60 sample sites were distributed across the three remaining CDBG jurisdictions: non-principal cities with a population over 50,000 (9 sites), urban counties ( 15 sites), and non-entitlement/rural areas ( 36 sites). Appendix A lists all CDBG jurisdictions in the sample.

## Exhibit B-2: Number of Sites in Universe and Sample by Region-CDBG Type

| Stratum | Number of Geographic Areas in Universe | Number of Certainty Sites in Sample | Number of Noncertainty Sites in Sample | Total Sample |
| :---: | :---: | :---: | :---: | :---: |
| Northeast Principal City | 86 | 3 | 5 | 8 |
| South Principal City | 151 | 4 | 8 | 12 |
| Midwest Principal City | 124 | 3 | 7 | 10 |
| West Principal City | 106 | 5 | 7 | 12 |
| Northeast City >50,000 | 81 | 1 | 2 | 3 |
| South City >50,000 | 48 | 0 | 2 | 2 |
| Midwest City >50,000 | 55 | 0 | 1 | 1 |
| West City > 50,000 | 114 | 0 | 3 | 3 |
| Northeast Urban County | 33 | 0 | 3 | 3 |
| South Urban County | 54 | 0 | 4 | 4 |
| Midwest Urban County | 33 | 1 | 3 | 4 |
| West Urban County | 34 | 1 | 3 | 4 |
| Northeast Non-entitlement County | 148 | 0 | 6 | 6 |
| South Non-entitlement County | 812 | 0 | 11 | 11 |
| Midwest Non-entitlement County | 890 | 0 | 11 | 11 |
| West Non-entitlement County | 373 | 0 | 8 | 8 |
| Total | 3,142 | 18 | 84 | 102 |

## Addition of Contributing Sites

In addition to the 102 sample sites selected for the study, many other communities nationwide volunteered to provide data for the report to help produce more precise national estimates. The additional communities are entire Continuums of Care and are termed "contributing sites." In the 2009 AHAR, 246 contributing communities provided data for use in the AHAR report. As with the sites selected with certainty, data from the contributing sites represent themselves in the national estimates. Appendix A lists the sample and contributing communities in the 2009 AHAR.

## B. 4 AHAR Data Cleaning

This section presents the data cleaning results for the AHAR. For each AHAR sample site and contributing community, the study team reviewed each reporting category (e.g., ES-IND) for reporting irregularities, focusing on three indicators:

- HMIS-bed coverage rate
- Average daily bed utilization rate
- Proportion of missing variables

## Bed Coverage Rate

HMIS-bed coverage rate refers to the proportion of beds in a community that participate in HMIS. The HMIS-bed coverage rate is equal to the total number of HMIS-participating beds divided by the total number of beds in a community. The indicator is important because the accuracy of the extrapolation technique depends on obtaining reasonably high bed coverage rates. ${ }^{13}$ The study team evaluated each reporting category on its own merits-that is, calculated an HMIS-bed coverage rate for ES-IND, ES-FAM, TH-IND, and TH-FAM separately-and excluded from the final AHAR analysis any reporting category with an HMIS-bed coverage rate below 50 percent.

## Average Daily Bed Utilization Rate

Average daily bed utilization rate refers to the frequency of bed use on an average day. It is equal to the number of homeless persons who use a program on an average day during a specified period divided by the total number of year-round equivalent beds ${ }^{14}$ in the current inventory during the same period. Utilization rates above 100 percent typically indicated missing exit dates in the HMIS; unusually low utilization rates often suggested that providers did not enter data on all clients served into HMIS. In situations where unusually high or low utilization rates could not be explained or confirmed as accurate by the community, the study team excluded from analysis all data from the reporting category.

## Proportion of Missing Variables

Missing data limit the ability to present a complete picture of homelessness. Exhibit B-3 presents the proportion of missing values for the weighted 2009 AHAR data. The data element most constrained by missing values was length of stay in prior living arrangement, which was missing for 24 percent of adult clients. Though still a high rate, 2009's rate of missing disability status is considerably lower than the missing disability rate in the 2008 AHAR (28.9 percent). The missing data rates for disability status (10.6 percent) and prior living situation (10.9 percent) were around half the rate in earlier AHARs. Missing rates have also declined for most other data elements but still remain high for data that

[^31]communities were not required to collect before release of HUD's Data Standards, such as ZIP code of last permanent address (19.1 percent).

The study team did not exclude reporting categories from the AHAR analysis file because of missing data. Instead, the estimates are based on non-missing data, and the team has marked estimates in the AHAR report based on data elements with missing rates over 20 percent.

Based on the data-quality indicators, the study team classified all sample sites and the contributing communities into five categories describing the usability of their AHAR data. Exhibit B-4 summarizes the findings. Overall, 334 communities participated in the AHAR, including 88 sample sites and 246 contributing communities. Overall, 137 communities (42 sample sites and 95 contributing communities) provided usable data across all four reporting categories; 171 communities ( 20 sample sites and 151 contributing communities) submitted usable data for only some of their reporting categories; and 26 had no emergency shelter or transitional housing providers located within the sample site. ${ }^{15}$

[^32]| Exhibit B-4: 2009 AHAR Participation Status of Sample and Contributing <br> Communities |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: |
| Status | Total |  | Number of <br> Sample Sites | Number of <br> Contributing <br> Communities |
| Percentage | Number |  |  |  |
| Participating in the AHAR |  |  |  | 95 |
| All table shells | 30 | 137 | 42 | 151 |
| Partial table shells | 37 | 171 | 20 | - |
| Complete Zero Providers | 6 | 26 | 26 | 246 |
| Subtotal | 72 | 334 | 88 |  |
| Not Participating in the AHAR |  |  |  | 54 |
| Submitted unusable data | 14 | 63 | 9 | 61 |
| No data submitted | 14 | 66 | 5 | 115 |
| Subtotal | 28 | 129 | 14 | 361 |
| Total Communities | 100 | 463 | 102 |  |

In total, 14 of the 102 sample sites ( 14 percent) were unable to participate in the AHAR, in most cases because implementation issues prevented the site from producing information from their HMIS. A few of the sites were far enough along to submit data but were still working through implementation problems or had recently made major changes to their system that raised questions about the data quality. The study team judged data to be unusable if the bed coverage rate was below 50 percent; if the bed utilization rates were unreasonably high/low and could not be properly explained; if the community contact expressed concern over data accuracy; or if the other quality control procedures raised issues that site staff could not rectify.

The 2009 AHAR witnessed a year-over-year increase of 112 communities contributing useable data (from 222 in 2008 to 334), an increase of 50 percent. Moreover, the number of usable reporting categories increased from 507 in the 2008 AHAR to .794 in the 2009 AHAR. (Exhibit B-5 shows the number of usable reporting categories for the 2009 AHAR.) In total, there were 607,140 person-records reported across the AHAR reporting categories and used to generate the national estimates.

| Exhibit B-5: Number of Usable Reporting Categories by Program-Household Type, <br> 2009 |  |  |  |
| :---: | :---: | :---: | :---: |
| Program-Household Type | Total | Sample Sites | Contributing <br> Communities |
| Emergency shelters for individuals | 179 | 33 | 146 |
| Transitional housing for individuals | 198 | $45(44)$ | 153 |
| Emergency shelters for families | 185 | 39 | 146 |
| Transitional housing for families | 232 | 44 | 188 |
| Total | 794 | 161 | 633 |

Note: The tallies include only the reporting categories where the site has providers in a given category and provides usable data. The table does not include the 29 complete zero provider sites.

## B. 5 AHAR Weighting and Analysis Procedures

This section describes the process of obtaining national estimates from the raw HMIS data submitted by participating communities. The estimates of the number and characteristics of the homeless population using homelessness services are based on weighted data. The study team designed the sampling weights to produce nationally representative estimates from the sites that provided data. The steps for obtaining the final estimate are listed here and described in more detail below.

- Step 1: Staff from the AHAR sample sites filled out reporting categories with information (raw data) from emergency shelters and transitional housing providers that had entered data into their local HMIS.
- Step 2: The raw data were adjusted by reporting category within each site to account for providers that did not participate in the site's HMIS.
- Step 3: Base sampling weights were developed for all selected sites based on the assumption that 100 percent of the AHAR sample sites provided information.
- Step 4: Base sampling weights were adjusted to account for contributing sites.
- Step 5: Weights were adjusted for nonresponse to determine the preliminary analysis weights.
- Step 6: Based on national totals of emergency and transitional housing beds, a post-stratification adjustment was made to arrive at the final analysis weights.
- Step 7: A final adjustment factor was derived to account for people who used more than one type of homeless service provider.
- $\quad$ Step 8: National estimates were calculated by using the final weight (Step 6) and the final adjustment factor (Step 7).

Step 1: Staff from AHAR sites filled out reporting categories with information from emergency shelters and transitional housing providers that had entered data into their local HMIS.

Participating communities logged into the AHAR Exchange-the web-based data collection tool designed for the AHAR-and entered the information (raw data) on the number of homeless persons, their characteristics, and their patterns of service use. The information was reported separately for each reporting category: individuals using emergency shelters (ES-IND); persons in families using emergency shelters (ES-FAM); individuals using transitional housing (TH-IND); and persons in families using transitional housing (THFAM). The information was then aggregated into a fifth set of tables, the summary tables, to provide total cross-program estimates for the site. A public version of the AHAR Exchange is available for viewing and local use: http://sandbox.hmis.info/.

Step 2: The raw data were adjusted by reporting category within each site to account for providers that did not participate in the site's HMIS.

Where participation in the HMIS was less than 100 percent, the raw data at each site were upwardly adjusted to account for nonparticipating providers (i.e., providers that did not submit data to HMIS). This adjustment, or extrapolation, was carried out separately by reporting category within each site. The extrapolation technique assumes that nonparticipating providers serve the same number of unique persons per available bed as participating providers during the study period. It makes a small adjustment for the overlap between users of participating and nonparticipating providers. ${ }^{16}$

The post-extrapolation results for each site are estimates of the homeless population served by each reporting category and the total sheltered homeless population at all emergency shelters and transitional housing in the entire site during the study period.

Step 3: Base sampling weights were developed on the assumption that 100 percent of the AHAR sample sites provided information.

The study team selected the largest sites (i.e., the CDBG jurisdictions with the largest populations) with certainty. As such, each site's base sampling weight is 1.0 , meaning that each respective site's data represent only that site. The study team divided the noncertainty sites into 16 strata based on the four Census regions (East, West, Midwest, and South) and four CDBG types (three types of entitlement communities-principal city, urban county, other city with population greater than 50,000-and one type of non-entitlement community). The base sampling weights for the noncertainty sites are the inverse of the probability of selection. For example, if 1 out of 100 sites was selected in a stratum, the base sampling weight for selected

[^33]sites in that stratum would be 100 (the inverse of $1 / 100=100$ ). Each noncertainty site in a stratum had the same chance of being selected; therefore, each has the same weight.

If all the sample sites provided full AHAR data (in the absence of contributing sites), national estimates of the homeless population would be calculated by multiplying each site's base sampling weight by the extrapolated number of persons with each characteristic at the site and then aggregating across sites.

## Step 4: Base sample weights were adjusted to account for contributing sites.

Two hundred forty-six communities volunteered to provide their HMIS-based data for the 2009 AHAR. The data from these communities-or contributing communities-increase the reliability of the AHAR estimates. The study team treated all of these sites as certainty sites and assigned them a weight of 1.0 such that each site would represent only itself in the national estimates. The study team adjusted the base sampling weights of the noncertainty sites downward to represent only the noncontributing sites in their respective stratum. For example, assume that there were two sample sites in a stratum and that both originally had a base weight of 100 . If the contributing sites represented 10 CDBG jurisdictions in that stratum, the sample weight for each sample site would be downwardly adjusted to 95 . In other words, the two sample sites originally represented 200 sites in their stratum, but, with the contributing sites now representing 10 of those 200 sites, the sample site needs to represent 190 sites. The addition of the contributing sites did not affect the base sampling weights of the certainty sites.

If all the sample sites and contributing sites provided full AHAR data, the study team would calculate national estimates of the homeless population by multiplying each site's base weight by the extrapolated number of persons with each characteristic at the site and then aggregating across sites.

## Step 5: The base weights were adjusted for nonresponse to derive the preliminary analysis weights.

The above base weights assume that all the sample and contributing sites provided data for all four reporting categories except for those for which they have no providers in their jurisdiction. Unfortunately, 14 sample sites were not able to provide any usable data, and 20 other sample sites were unable to provide data for all their reporting categories (i.e., they provided partial data). One hundred fifty-one contributing sites also provided only partial data. In addition, 26 sample sites had no providers (i.e., no emergency shelters or transitional housing programs). The 'zero provider sites’ are part of the estimate (because they represent themselves and all nonsample zero provider sites in the population) but need to be treated differently from the other sites. Once the study team confirmed that the site had no providers, it needed no further information. Given that the zero provider sites did not have any information for the AHAR reporting categories, none of them was a nonrespondent.

Recognizing that some participating sites provided only partial data (i.e., data on some but not all of their reporting categories) and that the data proved useful for the AHAR report, the study team carried out the nonresponse adjustment to the weights separately for each of the four reporting categories. That is, each site contributing data to the AHAR has four analytic weights-one for each reporting category. However, for any reporting category for which a site was not able to provide data, the analytic weight is zero. The respondent sites for that reporting category represent the site. (Step 8 describes the procedure for aggregating across reporting categories to arrive at national estimates.)

Below is a description of how the weight for each type of site was adjusted for nonresponse to derive the final analysis weights.
(a) The weights of the contributing sites did not change; each contributing site continued to represent itself with an analytic weight of 1.0 for each programhousehold type for which it provided data.
(b) The weights of the no-provider sites did not change. Their weight remained the base weight calculated in Step 4 because all zero provider sites in the sample are considered respondents. In essence, the no-provider sites produced a response of 100 percent. Stated differently, since none of the non-response sites has no providers, the no-provider sites would not appropriately represent them.
(c) For the certainty sites providing data, base weights were adjusted so that the analytic weights represented all certainty sites. The adjustment was made separately for each program-household type within four weighting classes based on region: North, South, East, and Midwest. ${ }^{17}$ The nonresponse adjustment was based on the relative number of shelter beds in the nonrespondent sites and accounts for the possibility of a high degree of size variation among certainty sites. The nonresponse adjustment formula follows:

| Total number of beds within a |
| :---: | :---: | :---: |
| reporting category at certainty sites in |
| region |$\quad \div \quad$| Number of beds within reporting |
| :---: |
| category at respondent certainty sites |
| in region |

For example, assume that six of the seven certainty sites in the West provided THIND data and that one site did not. If the nonrespondent certainty site had $1,000 \mathrm{TH}-$ IND beds and the six participating certainty sites had 5,000 beds, the weight of the six participating certainty sites would be multiplied by 6/5 (6,000 divided by 5,000 ).

[^34]The adjustment assumes that the nonrespondent certainty sites would serve approximately the same number of persons per bed as the participating certainty sites. The nonresponse adjustment for certainty sites was derived separately by region based on the judgment that homeless providers in principal cities in the same region were more likely than principal cities overall to serve persons with similar characteristics.
(d) For the noncertainty sites, the weights of the participating sites were upwardly adjusted to represent all the sites meant to be represented by the nonrespondent sample sites. The adjustment was carried out separately for each program-household type within 16 weighting classes based on type of CDBG jurisdiction and region: (1) principal city, (2) city with greater than 50,000 population, (3) urban counties, and (4) and nonentitlement areas. The nonresponse adjustment was the same as that used for certainty sites--the ratio of total number of beds in the weighting class divided by number of beds in participating sites.

Step 6: A post-stratification adjustment was carried out to create final analysis weights.
A post-stratification adjustment based on national totals of emergency and transitional housing beds accounted for new CDBG jurisdictions added since 2002 as well as for any differences in the average size of sample and nonsample sites. This final adjustment to the analysis weights applied only to noncertainty sample sites. The preliminary analysis weight (from Step 5) is the final analysis weight for certainty sites, no-provider sites, and contributing sites.

The initial AHAR sample was drawn from the number of CDBG jurisdictions in existence in 2002. Since that time, however, the number of CDBG jurisdictions has increased from 3,142 to $4,115 .{ }^{18}$ Therefore, the study team adjusted the analysis weights to account for the expansion. The increase in CDBG jurisdictions was not evenly distributed; most of the growth occurred in the South, particularly in the rural South. Thus, we adjusted the weights separately for each of the 16 strata. The adjustment factor was the ratio of total number of beds in the strata in 2009 (after excluding beds from certainty and contributing communities) to the weighted number of beds in the noncertainty sample sites in the strata providing usable data. The number of beds for the adjustment was based on the housing inventory chart submitted as part of the 2009 CoC application.

The adjustment both corrected for the difference in the number of CDBG jurisdictions in CoCs between 2002 and 2009 and adjusted for any differences in the number of beds per CDBG sample site and CDBG nonsample site in the same stratum.

[^35]The Step 6 weights are the final analysis weights for use with the sample and data provided to produce separate national estimates of the homeless population for each reporting category. However, to aggregate the data across reporting categories, a further adjustment is needed to account for persons who used more than one program type during the study period.

## Step 7: Final adjustment factor was derived to account for users of several program types.

To calculate national estimates that require data aggregation across the four reporting categories, an adjustment is needed for persons who used more than one program-household type during the study period. That is, if a person used an emergency shelter for individuals and then a transitional housing program for individuals, the person will appear in more than one set of reporting categories for the study period; aggregation of the numbers from the four reporting categories would double count that person. The needed adjustment is the same type of adjustment embedded in the AHAR summary table for sites providing data on all four reporting categories. For the 137 participating sites ( 42 sample sites and 95 contributing communities) providing data on all four reporting categories, the adjustment factor was the actual adjustment factor calculated from how much overlap the sites reported with their HMIS data. However, for the 171 participating sites that provided only partial data, it was not possible to calculate the overlap adjustment factor from their data. Instead, for all partial reporting sites, the study team used the average overlap adjustment factor from the 137 sites providing full data. Thus, for partial reporting sites, the overlap adjustment factor was assumed to be 0.956 .

The overlap adjustment factor was calculated as follows:

| Total unduplicated number of persons <br> served at the full-reporting sites | $\div \quad$Total number of persons served at the full <br> reporting sites before accounting for persons <br> served by more than one program-househol <br> type |
| :---: | :---: |

## Step 8: Calculate national estimates.

To calculate national estimates, the study team first calculated the total number of persons with each characteristic within each of the four reporting categories. Then, within each reporting category, the team multiplied the final analysis weight (from Step 7) for each site by the number of persons with that characteristic in that site's reporting category. Next, the team summed the number of persons in each site across sites to arrive at the estimated number of persons with that characteristic who were served in that reporting category. For estimates of the number of persons served by all four reporting categories, the team summed totals across the four reporting categories and then multiplied by the adjustment factor from Step 7. Percentage calculations followed the same procedures by calculating both the numerator and denominator of the desired percentage.

## Appendix D

Counts of Homeless Sheltered Persons Using HMIS Data

| Appendix D-1: Estimate of Sheltered Homeless Individuals and Families during a One-Year Period, October 2008-September 2009 |  |
| :---: | :---: |
| Household Type | Number of Sheltered Persons |
| All Sheltered Persons... | 1,558,917 |
| ...in emergency shelters only | 1,207,229 |
| ...in transitional housing only | 284,616 |
| ...in both emergency shelters and transitional housing | 67,072 |
| Individuals... | 1,034,659 |
| ...in emergency shelters only | 840,394 |
| ...in transitional housing only | 149,760 |
| ...in both emergency shelters and transitional housing | 44,504 |
| Persons in Families... | 535,447 |
| ...in emergency shelters only | 375,334 |
| ...in transitional housing only | 134,069 |
| ...in both emergency shelters and transitional housing | 26,044 |
| Households with Children | 170,129 |
| Note: Counts may not add up to total because of rounding. |  |

Source: Homeless Management Information System data, October 2008-September 2009.

[^0]:    1 The nine Continuums of Care are: Cincinnati-Hamilton County CoC, Detroit CoC, Idaho Balance of State CoC, Iowa Balance of State CoC, Memphis CoC, New York City CoC, Phoenix-Maricopa County CoC, San Francisco CoC, and Seaside-Monterey County CoC. The interview participants were local service providers located within each of these communities. The interviews in Idaho and Iowa were with service providers located throughout the state.

[^1]:    ${ }^{2}$ This includes all year-round and seasonal beds, but excludes overflow or voucher beds. HMIS-bed coverage is lowest among emergency shelters ( 65.2 percent) and highest among permanent supportive housing ( 72.9 percent) and safe havens ( 96.3 percent).
    3 An unduplicated estimate means that each person is counted once during a given time period, even if the person is served multiple times during that period.
    4 Some Continuums of Care submitted data for the sample site located within its jurisdiction, as well as data for the balance of the CoC. The unduplicated count of CoCs that participated in the 2009 AHAR is 296.

[^2]:    5 Adding the unsheltered count from the Point-in-Time estimate to the HMIS-based one-year count would miss people who were unsheltered on some other night during the year but not when the "street count" was conducted. On the other hand, adding the unsheltered count also would double-count the large fraction of the people who are unsheltered homeless on a particular night but who go to emergency shelters at some time during a year and are already counted in the HMIS data.

[^3]:    ${ }^{6}$ Painter, Gary. 2010. What Happens to Household Formation in a Recession? Research Institute for Housing America and the Mortgage Bankers Association.

[^4]:    7 CoCs are required by HUD to conduct an annual count of their sheltered and unsheltered homeless population every other year, starting in 2007, then 2009, and so on. Many CoCs, however, voluntarily choose to conduct a PIT count each year. In 2008, a third of CoCs did not conduct a new count, but rather reported their 2007 data for the 2008 counts.

[^5]:    8 Los Angeles' point-in-time totals were based on four sources. First, a street count of unsheltered homeless persons conducted over a three-day period in January, covering over 40 percent of the city's census tracts. Several "hot spot" census tracts were selected with certainty (the same hot spots identified in the 2007 PIT count), and all other tracts were selected through stratified random sampling. The results from selected census tracts were extrapolated to provide estimates for the entire CoC. Between 2007 and 2009 the number of people found living in unsheltered locations within Los Angeles decreased from 35,333 to 17,750. Second, the CoC conducted a count of sheltered persons in all of Los Angeles' 452 emergency shelters and transitional housing programs. The number of persons in the sheltered count increased from 11,442 in 2007 to 14,050 in 2009. Third, an enumeration of the "hidden homeless" was conducted via a telephone survey to estimate the number of homeless persons who were sleeping on private property outside a place of residence' (e.g., a car or encampment) at the time of the PIT count. A total of 4,288 households within the Los Angeles CoC responded to the telephone survey and the results were extrapolated to provide a CoC-wide estimate of the hidden homeless. This estimate was included in city's unsheltered count. The 'hidden homeless' estimate decreased from 20,746 in 2007 to 9,968 in 2009. Finally, a separate count of unsheltered homeless youth was conducted in March. The count was organized by eight providers of services to homeless youth, and the enumeration took place in neighborhoods where homeless youth are typically found. Unlike the unsheltered street count, the CoC did not extrapolate the estimates of homeless youth. The homeless youth count declined from 1,087 in 2007 to 926 in 2009. Taken together, these four sources indicated that the total count of homeless people on a single night in Los Angeles decreased from 68,608 to 42,694 between 2007 and 2009.
    9 The City of New Orleans did not conduct a new PIT count of homeless people in 2008, reporting their 2007 data in their 2008 application. However, the city's 2007 data were highly unreliable because the aftermath of Hurricanes Katrina and Ike made it very difficult to produce an accurate PIT count of homeless people. As a result, the change in the number of homeless people from 2007 to 2009 increased dramatically, from 1,619 to 8,725 . In the City of Detroit, the city applied an extrapolation factor to their 2008 data to account for people who may have been missed during their count of unsheltered people. The city chose not to apply this extrapolation factor to their 2009 counts, reporting their raw 2009 count without the extrapolation. As a result, the PIT count of homeless people declined dramatically, from 18,062 (in 2008) to 3,694 (in 2009).

[^6]:    10 A chronically homeless person is defined as an unaccompanied homeless individual with a disabling condition who has been either continuously homeless for a year or more or who has had at least four episodes of homelessness in the past three years. To be considered chronically homeless, a person must have been on the streets or in emergency shelter (e.g., not in transitional or permanent housing) during these stays. Prior to the passage of the HEARTH Act persons in families could not be considered chronically homeless.

[^7]:    11 Veterans status was only asked of adults. Substance abuse, mental illness, and HIV/AIDS status was asked of all adults and unaccompanied youth but not children in families.

[^8]:    12 See Appendix B for a description of the weighting techniques used to produce national estimates from HMIS data.

[^9]:    13 Single men who are poor may be more vulnerable to homelessness because of large gaps in the Unemployment Insurance program and because the largest safety net programs, such as Temporary Assistance for Needy Families (TANF) and Social Security, are for families or elderly people. The share of unemployed workers receiving unemployment insurance has declined in recent decades and the gap may be particularly perilous for men because poor women are likely to be accompanied by children and thus eligible for TANF. Adult poor men also have higher rates of substance abuse than women, but substance abuse has not been a categorical eligibility criterion for SSI since 1996. Thus, some women may fall through one social safety net but be caught by another; men may miss them all. See the 2008 Annual Homeless Assessment Report. U.S. Department of Housing and Urban Development, Washington D.C.
    14 The share of individual sheltered homeless men reported in the HMIS may be artificially high. First, the HMIS data do not include adults served by domestic violence providers, most of whom are women, because domestic violence providers are prohibited by the Violence Against Women Act of 1994 (reauthorized in 2000 and 2005) from participating in HMIS. Second, some shelters have policies prohibiting men over a certain age from sleeping in family shelters, requiring men and teenage boys to stay at men's shelters alone.

    A study of patterns of homelessness among families in four communities-Houston TX, Washington DC, Kalamazoo MI, and upstate South Carolina-tracked people from their first entry into the homeless services system (based on HMIS data) for 18 months ( 30 months in DC) and found that many adults who were homeless as part of a family during part of the tracking period used shelters for individuals at other times during the tracking period. Brooke Spellman, Jill Khadduri, Brian Sokol, and Josh Leopold, Costs Associated with First-Time Homelessness for Families and Individuals. U.S. Department of Housing and Urban Development, March 2010.

    17 O'Connell, James J. "Premature Mortality in Homeless Populations: A Review of the Literature," National Health Care for the Homeless Council. December 2005.

    18 Past reports counted each person in a multi-adult or multi-child household as an individual household composed of one person (i.e., a 1-person household). In this report, persons in these household compositions are counted as one household composed of multiple people. For example, a household composed of two adults with no children is counted as one household with a household size equal to two, rather than two households with household size equal to one each.

[^11]:    19 In the HMIS Data and Technical Standards (69 FR 45888, July 30, 2004), a disabling condition includes a diagnosable substance abuse disorder, in order to match the definition found in the regulations implementing the McKinney-Vento Act's Supportive Housing and Shelter Plus Care programs. However, the U.S. Census Bureau does not include substance abuse disorders as a form of disability, and thus the broader definition used by HUD is likely to result in larger estimates of homeless persons with disabilities compared to the U.S. poverty and general population.
    ${ }^{20}$ Turner, Margery, Carla Herbig, Deborah Kaye, Julie Fenderson, and Diane Levy. 2005. Discrimination Against Persons with Disabilities. U.S. Department of Housing and Urban Development. Washington DC.
    ${ }^{21}$ In 2009, the average monthly SSI payment was $\$ 504$ (or about $\$ 6,048$ annually) and the poverty level for a single-person household was $\$ 10,830$. U.S. Social Security Administration Office of Retirement and Disability Policy. Monthly Statistical Snapshot, March 2009. Available at http://www.ssa.gov/policy/docs/quickfacts/stat_snapshot/. See also: U.S. Department of Health and Human Services. The 2009 HHS Poverty Guidelines. Washington, DC. Available at http://aspe.hhs.gov/poverty/09poverty.shtml.

[^12]:    22 See the SSI/SDI Outreach, Access and Recovery (SOAR) Initiative:
    $\mathrm{http}: / / \mathrm{www}$. prainc.com/SOAR/soar101/what is soar.asp
    23 There were $1,034,659$ homeless individuals, nearly all of whom were individual adult males, individual adult females, or unaccompanied youth. There were also 25,216 adults in multi-adult households. Assuming 2 adults per multi-adult household and each individual as a household, the percent of households that were families is 14.3 percent (or 170,129 divided by $1,189,294$ ).

[^13]:    ${ }^{24}$ The percentage of unaccompanied youth in the shelter system may be higher if facilities that specifically target homeless youth-such as Runaway and Homeless Youth programs funded by the U.S. Department of Health and Human Services-are disproportionately not participating in HMIS. Bed inventory information reported by CoCs for 2009 suggests that 62.3 percent of all beds targeted to homeless youth currently participate in HMIS, compared to 74.5 percent of all beds in the national inventory. Thus, it is possible that the one-year estimates slightly undercount the total number of homeles youth in shelters.

[^19]:    32 See Appendix Exhibit D-4 in this report for other demographic characteristics of sheltered homeless families in 2009. The appendices in the 2007 and 2008 Annual Homeless Assessment Reports provide the demographic characteristics of sheltered persons for these years.
    33 Culhane, Dennis P., Stephen Metraux, and Jay Bainbridge. "The Age Structure of Contemporary Homelessness: Risk Period or Cohort Effect?" Working Paper: The University of Pennsylvania.

[^20]:    35 Culhane, Dennis P., Stephen Metraux, and Jay Bainbridge. "The Age Structure of Contemporary Homelessness: Risk Period or Cohort Effect?" Working Paper: The University of Pennsylvania.

[^21]:    ${ }^{36}$ Year-round beds are available for use throughout the year and are considered part of the stable inventory of beds for homeless persons.

[^22]:    ${ }^{37}$ The CoC application reports beds dedicated to unaccompanied youth separately from beds dedicated to victims of domestic violence, veterans, or persons living with HIV/AIDS. The exhibit assumes that beds dedicated to unaccompanied youth are mutually exclusive from beds dedicated to these other subpopulations.

[^23]:    ${ }^{1}$ The beds per capita rate is the number of residential beds per 1,000 people in the state. Puerto Rico and U.S. Territories are not included: Guam ( 294 beds and 1.60 beds per capita), Virgin Islands ( 175 beds and 1.6 beds per capita), and Puerto Rico ( 3,057 beds and 0.8 beds per capita).

[^24]:    38 Burt, Martha and Sam Hall. 2008. Transforming the District of Columbia's Public Homeless Assistance System. Washington D.C.: Urban Institute.

[^25]:    1 Data from AHAR sample sites is supplemented with data from other Continuums of Care that were not selected as part of the original sample but chose to contribute their HMIS data for the AHAR. These communities are called 'contributing communities'; unlike AHAR sample sites, contributing communities only represent themselves in the national estimates, meaning their data is not weighted to represent other communities to produce the national estimate.

[^26]:    2 The term victim service provider is defined as "a nonprofit, nongovernmental organization, including rape crisis centers, battered women's shelters, domestic violence transitional housing programs, and other programs whose primary mission is to provide services to victims of domestic violence, dating violence, sexual assault, or stalking" (72 FR 5056, March 16, 2007).

[^27]:    369 FR 45888, July 30, 2004.
    4 Two of the universal data elements (Veterans Status and Disabling Condition) are asked of adults only; two other data elements (Residence Prior to Program Entry and Zip Code of Last Permanent Address) are asked of adults and unaccompanied youth only.

[^28]:    5 The initial AHAR sample consisted of 80 jurisdictions. Some jurisdictions from the original sampleespecially jurisdictions representing rural areas-were unable to provide data to the AHAR because of HMIS implementation issues or other data quality concerns. In addition, several of the rural sample sites did not have any homeless residential service providers located in their jurisdiction. As a result, we were unable to report data by geography. In an effort to improve the scope and quality of data from rural jurisdictions, 22 additional rural jurisdictions were added to the AHAR sample. Thus, there are now 102 AHAR sample sites.

    6 The original file from which the sample was selected used the category of "central city" for CDBG jurisdictions rather than "principal city." However, the CDBG program moved to designation of principal city rather than central city following the OMB guidance, and the definition of central city and principal city are slightly different (see 24 CFR Part 570). Of the 482 CDBG central city jurisdictions that existed both before and after the definition change, 327 central city jurisdictions ( $68 \%$ ) became principle cities with the definition change. A small number of non-central cities (85 out of 2,501) in the original file were categorized as principal cities in the 2007 CDBG file. In our analysis by CDBG jurisdiction and in procedures for adjusting the sampling weights, we used the community's current CDBG jurisdiction to ensure that our results accurately represented the current system for designating CDBG jurisdictions.

[^29]:    7 HUD provided a file called "COC_GeoAreasInfo.xls" with a list of 3,219 CDBG jurisdictions, jurisdiction type, and population of each jurisdiction. Geographic areas in the U.S Territories and Puerto Rico and three duplicate records were eliminated, resulting in a sampling frame of 3,142 CDBG jurisdictions. In addition, four CDBG areas in Massachusetts and one in New Hampshire included overlapping geographic areas and double-counted the population; therefore, the population was evenly divided across the overlapping CDBG jurisdictions before sampling.
    ${ }^{8}$ Sampling based on the expected rate of homelessness is an attempt to obtain more precise estimates than those yielded by a simple random sample. If the proxy for the expected rate of homelessness is not correlated with the actual rate of homelessness, the resulting estimates will still be unbiased; however, the extra precision gains go unrealized.

    9 Burt, Martha. 2001. Homeless Families, Singles, and Others: Findings from the 1996 National Survey of Homeless Assistance Providers and Clients. Housing Policy Debate, V12 (4), 737-780. This report presents the share of the homeless population by urban/rural status. The share of the population in each type of geographic area comes from the author's calculations based on March 1996 Current Population Survey data. The results from the Burt study were based on central cities rather than principal cities, but we refer to them as principal cities here because of the high degree of overlap and to make the discussion easier to follow.

[^30]:    10 For 1990 counts, see U.S. Department of Housing and Urban Development. "Allocating Homeless Assistance by Formula." A Report to Congress, 1992. For 2000 counts, see U.S. Census Bureau. "Emergency and Transitional Shelter Population: 2000." A Census 2000 Special Report.
    ${ }^{11}$ The other 8 certainty sites in principal cities were all ranked in the top 15 in the 1990 or 2000 Census counts.

[^31]:    13 Before releasing the AHAR reporting requirements, the study team tested the extrapolation procedures with data from Philadelphia and Massachusetts under a variety of coverage rate assumptions, taking a random sample of providers (to match 50, 75, and 90 percent HMIS bed-coverage rates) and comparing the extrapolated estimates to the true population counts for these jurisdictions. The findings show that extrapolation estimates were accurate for HMIS bed-coverage rates above 50 percent and were more precise with higher coverage rates. The threshold of an HMIS bed-coverage rate of 50 percent was as representative as possible of a set of participating sample sites. (See 2004 National HMIS Conference Breakout Session Materials "Extrapolation Methods" for more information on the extrapolation testing, available at www.hmis.info.)

    14 A year-round equivalent bed counts seasonal beds as partial beds in direct proportion to the length of the covered period for which the provider makes the bed available. For example, a bed from a provider with a seasonal bed open in January, February, and March would count as one-fourth of a bed if the covered period were 12 months.

[^32]:    ${ }^{15}$ These sites still contribute to the national count of homelessness because they represent other communities with no providers.

[^33]:    16 Given that data from nonparticipating providers were not available, it is impossible to verify this assumption. However, it is the most reasonable assumption in that it is accurate when nonparticipating providers are missing at random or at least not systematically missing in a way correlated with the number of people they serve per available bed.

[^34]:    ${ }^{17}$ Fifteen of the 18 certainty sites are principal cities; therefore, the nonresponse adjustment essentially occurs within CDBG type.

[^35]:    18 The 4,115 CDBG jurisdictions also include nonfunded CDBG jurisdictions not part of the original sampling frame.
