BENDING THE HEALTH COST CURVE: THE PROMISE AND PERIL OF THE INDEPENDENT PAYMENT ADVISORY BOARD

Ann Marie Marciarille and J. Bradford DeLong*

ABSTRACT

Underlying today’s and the future’s health-care reform debate is a consensus that America’s health-care financing system is in a slow-moving but deep crisis: care appears substandard in comparison with other advanced industrial countries, and relative costs are exploding beyond all reasonable measures. The Obama Administration’s Patient Protection and Affordable Care Act (“ACA”) attempts to grapple with both of these problems. One of ACA’s key instrumentalities is the Independent Payment Advisory Board—the IPAB, designed to discover and authorize ways to reduce the rate of growth of Medicare and other categories of health spending. The IPAB is a peril. Expert boards to perform regulatory tasks in the interest of efficiency and social goals always run a high risk of being captured by the industry they are supposed to regulate. Even should it succeed at its task of reducing the rate of growth of Medicare spending, who is to say that the reductions will not come at a heavy cost in reduced quantity and effectiveness of medical care? But the IPAB also has promise. The need for a better process than our current specialist-driven one to assign value to the medical services provided by Medicare is great. The bellwether status of Medicare payment systems means that commercial insurance consumers and payors would also benefit mightily from bringing more coherent, technocratic, and cost effectiveness-oriented logic to this process. And the current system of relative Medicare reimbursement rates is, in the judgment of many, currently well out of whack. We quail when we consider the magnitude of the tasks the IPAB faces—even its initial task. Nevertheless, we remain optimistic that this administrative agency will manage to bend the long-run health-care cost curve and moderate future price increases.

VII. CONCLUSION
INTRODUCTION

Underlying the current and future health-care reform debate is a consensus that the American health-care financing system is in a slow-moving but deep crisis.

Figure 1: Life Expectancy and Health Expenditures per Capita in the OECD

![Graph showing life expectancy and health expenditures per capita in the OECD.]

Source: Lane Kenworthy calculations from OECD data.

It is conventional wisdom among health policy analysts that over the past generation America's hybrid health-care system has fallen far short, measured against the yardstick of health care expenses and outcomes in other developed economies. Figure 1 shows an especially striking slice of the cross-national comparative quantitative data. Up until the end of the 1970s, the United States was, in both life expectancy and health expenditures, in the outfield but still in the ballpark relative to its natural yardstick countries. Since the start of the 1980s, the United States’ trajectory has diverged: life expectancy has risen more slowly and health costs have ballooned much more rapidly than in the natural yardstick

---

The reaction to this slow-moving but deep crisis over the past generation has been recurrent cries for and attempts to pass comprehensive health-care reform not just to improve access to health care and improve the quality of health care but also to “bend the cost curve”—to control rising costs. The latest attempt to reform America’s health-care delivery and financing systems is the Patient Protection and Affordable Care Act of 2010 (“ACA”). The three most important focuses of the ACA were indeed (1) to improve access to health care, (2) to improve the quality of health care, and (3) to control costs.

The principal instrumentality for this third goal of the ACA is its establishment of the Independent Payment Advisory Board (“IPAB”), an administrative board whose principal initial task will be the reform of Medicare’s procedure-based reimbursement system. Medicare pricing is notoriously byzantine and poorly understood. It is also desperately important for long-run cost control. It is not an overstatement to say that the long-term viability of social insurance in America depends on whether IPAB is able to successfully manage Medicare pricing.

This article attempts to lay out the IPAB’s assigned tasks, and assess its ability to succeed. That is best accomplished by telling the story of how Medicare currently organizes physician payment, and how it is to be reformed. We quail when we consider the magnitude of the tasks the IPAB faces—even its initial task. Nevertheless, we remain optimistic that this administrative agency will manage to bend the long-run health-care cost curve, and moderate future price increases.

Our current political debate about health care is really three debates.

The first is a debate about the proper reach of the social insurance

---

2 The natural yardstick countries for the United States consist, generally, of other western industrialized countries: western Europe, Canada, and Japan, Australia, and New Zealand on the Asian Pacific Rim. Similar patterns of demography, levels of prosperity, access to technology, and political economy suggest that outcomes attainable in any of these countries should also be attainable in others. It is worth noting that the Canadian federal government and the Canadian provinces are also working to develop a balanced and sustainable health care growth rate through the development of a federal-province escalator formula tied in some way to Canada’s GDP. See Randall Palmer, Canada Seeks a Way to Limit Health-Spending Increases, (Dec. 14, 2011) athttp://www.reuters.com/article/2011/12/14/us-canada-health-spending-idUSTRE7BD2CO20111214.
state: how much access to how much medical care do we wish our health-care financing and delivery systems to provide, particularly for those with limited means? The second is a debate about how much of a role the government will take in the health-care financing and delivery systems: In other words, markets or bureaucracies? Government as backstop or provider? Decentralized or centralized?

The subject of this article is the third debate: How much health care spending can Americans afford? And, in the end, how do we structure our health-care financing system so that we do not conclude that the ambitions of the social insurance system are quite literally unaffordable? Today’s political debate about health care reform is thus about our desire and ability to “bend the cost curve” as a decisive factor in the future of government-funded, supported, and regulated health insurance.

This third debate is especially important because the American health care system delivers less bang for more buck than do the health care financing and delivery systems of the natural yardstick nations. American patients are less healthy and pay more. Successful health care reform and successful health care policy management must require a more efficient health-care financing system. That is what the ACA’s cost-control provisions are intended to produce.

At the heart of the ACA’s cost-control provisions is the IPAB. From 2015 on, in any year which the Medicare Actuary forecasts that net spending growth will exceed target levels, the IPAB is charged with developing specific proposals to bring the net growth in Medicare spending back to target levels. The IPAB is forbidden from raising taxes, increasing Medicare premiums, increasing Medicare co-payments or deductibles, or in

---

4 From 2015 to 2019, the target growth rate will be based on a synthesis of the Consumer Price Index for All Urban Consumers (“CPI-U”) and the medical care expenditures category in the CPI-U. From 2020 forward (based on determination year 2018 data for proposal year 2019 and implementation year 2020) the target for spending will be linked to the growth in the national gross domestic product (“GDP per capita”) plus one percentage point. The transition to a Medicare growth rate linked to GDP per capita will occur first by linking to growth in health care prices and, eventually, by linking to growth in the larger economy. 42 U.S.C.A. § 1395kkk(c)(2)(A)(i) (2010).
any way rationing health care. Given all these things that the IPAB cannot do, what can the IPAB do? The low-hanging fruit that the IPAB is intended to first and most importantly pick is to alter the process by which Medicare sets its out-patient reimbursement rates.

The functioning of the IPAB will be an experiment by Congress in binding itself to the mast, as Odysseus did when confronted by the Sirens. In the past Congress has exercised its discretion to reject—or, rather, to fail to act on—proposals to reform Medicare reimbursement rates put forward by entities Congress created to advise it. The belief is that the IPAB process, which removes much of Congress’s discretionary authority not to act over recommendations on rates, will lead to Medicare payment decisions that are closer to the social optimum.

This ambitious attempt to reform Medicare physician payments via the IPAB is also the weak point of the ACA. It carries all of the tension between collective overconsumption and overspending on the one hand and less-than-socially-optimized individual choices on the other. How can the IPAB’s proposals slow the growth of Medicare spending without imposing an unacceptably high cost in terms of reduced quality or amount of care? The IPAB, if it works, will harness the enormous purchasing power of the federal Medicare program for the task of bending the cost curve not just for Medicare alone but for health care in general by reworking physician payment standards. But if it is to work at acceptable cost it must trigger improvements in the efficiency of the health-care delivery system and not just say “no” to cost increases.

6 Id.
7 Congressional authority to delegate power under broad general directives is grounded in the understanding that complex technical problems may require delegation of legislative power in complex technical areas. See generally Mistretta v. United States, 488 U.S. 361, 372 (1989) (recognizing that increasingly complex technical problems may require Congressional ability to delegate power under broad general directives).
8 The problem of distributive justice is particularly acute in a society where health care expenditures exceed 16 percent of GDP. The inherent difficulty of allocative decisions is enhanced by our society’s insistence that allocative decisions are not made -- by patients, providers, and payors -- on a daily basis. The Long-Term Outlook for Health Care Spending, CONG. BUDGET OFF. http://www.cbo.gov/ftpdocs/87xx/doc8758/maintext.3.1.shtml (last visited Oct. 26, 2011).
The long-run effects of the IPAB on health-care costs—if the Board survives, and if its implementation is successful—are projected to be enormous. The Congressional Budget Office (CBO) projects that, as of 2040, federal expenditures on health care will be lower by 2 percent of Gross Domestic Product (GDP)—or $600 billion each year—because of the successful implementation of the ACA.\textsuperscript{10} If these forecasts are accurate, the IPAB would slow the growth in costs of today’s existing federal health care programs by a third over the next generation, with the savings coming overwhelmingly from Medicare.\textsuperscript{11}

The IPAB is a peril. Expert boards to perform regulatory tasks in the interest of efficiency and social goals always run a high risk of being captured by the industry they are supposed to regulate. Even if it should succeed at its task of reducing the rate of growth of Medicare spending, who is to say that the reductions will not come at a heavy cost in reduced quantity and quality of medical care?

But the IPAB also has promise. The need for a better process than our current specialist-driven one to value the medical services provided by Medicare is great. The bellwether status of Medicare payment systems means that commercial insurance consumers and payers would also benefit

\textsuperscript{10} See THE 2010 LONG-TERM BUDGET OUTLOOK, CONG. BUDGET OFF. http://www.cbo.gov/doc.cfm?index=11579. Compare to THE 2009 LONG-TERM BUDGET OUTLOOK, CONG. BUDGET OFF. http://www.cbo.gov/ftpdocs/102xx/doc10297/06-25-ltbo.pdf. The CBO does not make it easy for its readers to untangle just how Congressional actions and changes in the economic environment interact to change its estimates of the long-run path of federal spending and revenues. However, Table 1-3 on page 15 shows a drop in the projected 50-year extended-baseline fiscal gap between program spending and revenues from 2.6\% of GDP projected in June 2009 to 0.8\% of GDP projected in June 2010. On the revenue side, revenues are boosted by the ACA’s tax on high-cost health plans. On the spending side, even the introduction of subsidies so that low- and moderate-income households without employer-sponsored insurance can afford to purchase health insurance via the ACA’s Exchanges and the remarkably-large expansion of Medicaid under the ACA are projected to be offset by other savings. The only place that such significant other savings could possibly come from in the CBO’s budget arithmetic is from the effects of the IPAB in bending the cost curve of federal Medicare spending.

\textsuperscript{11} Savings would come secondarily from reduced Medicaid expenditures. Improved efficiency in the health care system would mean that more elderly would be able to afford their Medicare cost-sharing without having to draw on Medicaid. If Medicare does indeed serve as a “price leader” in the antitrust sense and private insurance companies key their reimbursement rates to Medicare rates, there will be additional savings to the Federal government that will come from reduced subsidy payments to low-income Americans purchasing health insurance through the state-level health exchanges. However, these potential savings are speculative, and are not included in CBO estimates.
mightily from bringing more coherent, technocratic, and cost effectiveness-oriented logic to this piece of the American government. And the current system of relative Medicare reimbursement rates is, in the judgment of many, currently well out of whack.

We quail when we consider the magnitude of the tasks the IPAB faces—even its initial task. Nevertheless, we remain optimistic that this administrative agency will manage to bend the long-run health-care cost curve and moderate future price increases.

I. BACKGROUND: THE ROAD TO THE ACA

A. Yesterday’s Medicare Debate

The origins of our current health care dilemmas as they affect the federal budget—especially related to Medicare’s provider reimbursement system—are found in the 1960s. The presidential election of 1964 had powerful consequences. Democratic President Lyndon Baines Johnson not only won election over Republican nominee Barry Goldwater, Johnson carried with him the largest supporting congressional majorities since Franklin Delano Roosevelt.12

One major consequence of Johnson’s victory was the establishment of Medicare and Medicaid. These two programs transformed America's health-care financing system from a system funded by private charity, out-of-pocket payments, and private insurance (for those lucky enough to work for large and high-wage businesses) to the hybrid system we have today.13 Currently, half of America’s health-care financing system is composed of this mix of charity, out-of-pocket, and insurance.14 The other half is comprised of the federal single-payer system for elderly and some disabled

---

12 Given the role played by Barry Goldwater’s decision to challenge establishment Republicans like George Romney and Nelson Rockefeller in creating the Democratic-heavy legislative environment in 1965 and 1966 that enabled the creation of Medicare, there is some irony in the role of the Goldwater center’s active presence in today’s court cases seeking to hobble the reform of Medicare. See Generally Coons v. Geithner, No.2:10cv1714 (D.Ariz., May 10, 2011 (challenging Congress's creation of the Independent Payment Advisory Board (IPAB) as an unconstitutional delegation of Congressional powers to an unelected, unaccountable executive agency).

persons, called Medicare, and the federal/state single-payer system for poor and most disabled persons, called Medicaid.\textsuperscript{15} Together, they bring us materially closer to providing a safety net for Americans who find themselves in need of health care, but lack the financial resources to pay for it.

As the bill that was to establish Medicare and Medicaid moved through Congress in 1965, President Johnson sought to derail a threatened American Medical Association (AMA) boycott of his program. Johnson decided to offer doctors participating in Medicare generously-structured payment rules with little government oversight.\textsuperscript{16} Doctors would report to the government what they charged their non-Medicare patients for the services they provided to Medicare patients, and the government would pay the bill. There was no bureaucracy to intrude into doctors’ practices, and there were no accountants to demand a discount for the large buyer that was the nationwide government program.\textsuperscript{17}

The particular minimal-supervision payment rules Johnson established did not survive beyond the early 1980s.\textsuperscript{18} Nevertheless, Johnson’s decision to establish this particular Medicare provider

\textsuperscript{15} LAURA KATZ OLSON, THE POLITICS OF MEDICAID 1, 26 (2010).
\textsuperscript{17} In part, this was a response to rent-seeking by well-organized doctors looking to preserve their incomes and fearing the long-run effects of becoming an industry subject to heavy government regulation. On the one hand, the government was promising to boost demand by paying for their services. On the other hand, the government seemed likely to extend control. For an overview of how groups like doctors are successful in manipulating the government in such situations, see MANCUR OLSON, THE LOGIC OF COLLECTIVE ACTION (1966). The ideological reaction to Medicare proposals was remarkably intense, as was the political heat. Consider Representative Hallock of Indiana’s claim that after the passage of Medicare it would be impossible to preserve freedom for long in America: “We do not want socialized medicine . . . . When the American people wants [sic] something from Congress, regardless of its political complexion, if they make their wants known, Congress does what the people want . . . .” Eric Zorn, Ronald Reagan on Medicare, Circa 1961. Prescient Rhetoric or Familiar Alarmist Claptrap?, CHICAGO TRIBUNE BLOG (Sept. 2, 2009, 2:00 PM), http://blogs.chicagotribune.com/news_columnists_ezorn/2009/09/ronald-reagan-on-medicare-circa-1961-prescient-rhetoric-or-familiar-alarmist-claptrap-.html.
Ronald Reagan agreed, and warned that “behind [Medicare] will come other federal programs that will invade every area of freedom as we have known it in this country until one day, as Norman Thomas said, we will wake to find that we have socialism . . . . [W]e are going to spend our sunset years telling our children, and our children’s children, what it once was like in America when men were free.” Id.
\textsuperscript{18} As discussed below, in the 1980s the U.S. government began to tighten its control over Medicare payments in an attempt to standardize valuation of care in a process led by Dr. William Hsiao of the Harvard School of Public Health. See infra Part V.A.
reimbursement system still casts its shadow over Medicare and is one major source of the current projection fiscally-unsustainable Medicare cost growth.\textsuperscript{19} If IPAB succeeds, it will switch us off of the track that Johnson started us down in 1965.

\textit{B. Today’s Health-Care Reform Debate}

The three debates that make up our current struggle over health-care reform are conducted at three very different levels of generality.

The first is a debate about moral philosophy. Whose responsibility is it to assemble the resources to pay for the medical care that we will all seek over the course of our lifetimes? How much of the cost of medical care should properly rest on the individual seeking care? Does our answer to this change depending on whether the diseases needing treatment are “in the genes,” “in the lifestyle,” or appear to be simply accidental bad luck? How much of the cost of medical care should rest on groups of individuals, using private insurance companies as instrumentalities to voluntarily associate with one another to pool and spread risk? And how much of the cost of medical care is within the proper reach of the social insurance state—particularly for those with limited means? These questions of individual responsibility and social justice raised in this debate are important, divisive, and unresolved. We cannot deal with them in this paper.

The second is a debate about the proper boundary between the market and the state. Historically, there have been some areas from which we have broadly excluded the market. Americans have always elected or had their elected officials appoint judges and police chiefs, we have not bought judicial services from the lowest bidder, or allowed the low-bidding private security company to exercise the police powers of the state. Similarly, our military has always been a military of volunteers or conscripts, and not an assembly of mercenary companies. Education and health care, too, have historically been overwhelmingly provided by non-

\textsuperscript{19} As of 2007, before the beginning of the latest health-care reform debate, the CBO was projecting that in the absence of fundamental reforms to the federal laws governing the Medicare and Medicaid programs, “[f]ederal spending on Medicare (net of beneficiaries’ premiums) and Medicaid would rise from 4 percent of GDP in 2007 to 7 percent in 2025, 12 percent in 2050, and 19 percent in 2082.” State spending on Medicaid would be in addition to federal spending. CONG. BUDGET OFF., THE LONG-TERM OUTLOOK FOR HEALTH CARE SPENDING 2 (2007), \textit{available at} http://www.cbo.gov/fdpdocs/87xx/doc8758/11-13-LT-Health.pdf.
profit or public institutions rather than by for-profit corporations. Even health insurance was, until recently, largely non-profit and mutual. While in much of our society it is taken for granted that the market will provide, health care has been somewhat different. Should it have been? Should it still be? The second debate is about how much of a role the government ought to take in health-care financing and delivery systems. Should the government be a provider or merely a financer? Should the system as a whole be decentralized or centralized? How much do we trust markets, and how much do we trust bureaucracies? Once again, these questions raised in this debate are important, divisive, and unresolved. We cannot deal with them in this paper.

The subject of this article, then, is the third debate. How much health care spending can Americans afford? And, in the end, how do we structure our health-care financing system so that we do not conclude that the ambitions of the social insurance system are quite literally unaffordable? The fact that the American health care system delivers less bang for more buck than do the health care financing and delivery systems of the natural yardstick nations creates a rebuttable presumption that we are, in some way, doing it wrong. It would be understandable—a coherent social choice—if American patients were less healthy but paid less. It would be understandable if American patients were more healthy and paid more. But Americans are less healthy and pay more.

This fact leads to the conclusion that, no matter what the results or positions are in debates one and two, there is space for a health-care reform and successful health-care policy management that will produce a different and more efficient health-care financing system. That is what the ACA is intended to produce. The ACA largely ducked the first two debates, creating a complicated public-private system that could accommodate nearly any set of answers to those two. But it does seek to push the health-care financing system in the direction of greater efficiency—because the need is urgent.

C. A Poorly-Performing Health Care System

Our current hybrid health care system leaves us at any particular moment with about 50 million Americans without any form of health insurance coverage. As best as economists can determine, America's

---

uninsured get perhaps half the care standard for other Americans. The consequence is that Americans achieve worse health outcomes than do the citizens of any other rich, industrialized country. Americans’ life expectancy at birth now lags behind the industrial country average by approximately four years. It is true that the life expectancy gap is due in part to relatively unhealthy aspects of the contemporary American lifestyle. Smoking, poor nutrition, and suburbanization have taken their toll. But the gap in life expectancy has grown far larger over the past generation even as smoking rates have declined, nutritional standards have improved, and suburbanization has remained constant.

Moreover, the uninsured receive a disproportionate amount of their health care at relatively expensive, low-follow up emergency rooms, and thus get their care in a way that guarantees low value-for-money. This contributes to the other aspect in which American health care falls well short: America’s health care costs are much higher than in other countries. However, other contributing factors are even more important. The U.S. system has extraordinarily high administrative costs relative to other nations, because insurance companies face enormous bottom-line incentives to deny payment for even the most necessary and appropriate care.

http://www.census.gov/newsroom/releases/archives/income_wealth/cb11-157.html. Before the recession, over a typical four year period approximately twice as many Americans will experience a gap in insurance coverage as suffer from one at any single point in time. Before the recession, about two-thirds as many people as those uninsured at any point in time lack coverage more than half the time. The coming of the recession in 2008 will alter these patterns in ways we are not able to reliably predict. See Pamela Farley Short, Deborah R. Graefe and Cathy Schoen, I Issue Brief: Churn, Churn, Churn: How Instability of Health Insurance Shapes America’s Uninsured Problem, COMMON. FUND. (November 2003), http://www.commonwealthfund.org/usr_doc/Short_churn_688.pdf

24 See Mark J. Browne, Evidence of Adverse Selection in Health Care Markets, 59 J. RISK & INS. 13, 27 (1992); See also Scot T. Paltrow, Insurers’ Black Box: Now-Secret Claims Denied Rates Could Tell Consumers a Lot About Their Insurance Company, Center for
Bending the Health Cost Curve

U.S. system compensates and uses the most expensive medical care providers—specialists—at a rate vastly exceeding other economies.\(^\text{26}\) Health policy experts argue about the impact of pressure to provide more and more sophisticated care that is reinforced by the medical malpractice system. The general consensus, though, points instead to a lack of knowledge and consensus about which procedures and protocols are actually effective and appropriate.\(^\text{27}\) One informed guess indicates that about one-third of all care provided carries a social cost greater than the benefit to the patient. Another informed guess states that perhaps one-sixth of all care provided is affirmatively harmful to the patient.\(^\text{28}\)

In addition, the performance of the American health care system, relative to other countries, is likely to become worse over time. Nearly all projections anticipate that American medical costs will also continue to rise, and at a rate faster than that of other industrialized economies.\(^\text{29}\)

D. Tomorrow’s Reform of the Health-Care Financing System

Breaking this trend—bending the cost curve—is thus essential.

Bending the cost curve means making changes to the health care delivery and finance system to decrease the rate at which health care spending increases.\(^\text{30}\) Even in the universe of government funded health care...

\(^{30}\) Though the origins of the phrase “bending the cost curve” are obscure, William Safire attributes the migration of the aviation reference to being behind the power curve to no one...
insurance, Americans are uncertain who can bend the cost curve, and for good reason. Short of absolute fiat, the health care cost curve will not improve without changes in provider, payor, and consumer behavior. In a hybrid public/private health care system—such as our own—many private players have a role in determining government funded health care expenditures. It is a collective action problem, amenable only to collective, systemic solutions to overcome collective over-consuming and overspending.

In the absence of successful implementation of comprehensive health care reform, observers have noted five features of the ongoing process of health-care cost growth.

First, rapidly-rising publicly funded insurance health care expenditures are not being driven by a shifting of costs away from private payors—charity, out-of-pocket, and private insurance—to the public. Private and public costs and expenditures are rising in tandem, with the public side, if anything, better at achieving efficiencies and evading cost-shifting in health-care provision.

Second, the destructive adverse-selection arms race among the private insurance companies and others continues, with the company that does least well paying a disproportionate share of the bills, and winding up in the red. The result is that much of the increase in health care costs on the private side is directed towards administrative overhead in order to further exploit adverse selection. There are, so far, no signs that this arms race has come to an end or even stabilized at a constant proportional share of health-care expenditures. The incentives in the current system for insurers to find ways not to pay for the sick, and for the healthy to find ways not to pay into the system are simply too great.

less than President Obama himself. William Safire, Bending the Curve, NEW YORK TIMES, September 11, 2009.

32 Id.

34 See generally Karen Eggleston and Anupa Bir, Measuring Selection Incentives in Managed Care: Evidence From the Massachusetts State Employee Insurance Program, 16 J. OF RISK AND INSUR. 159, 161 (2009) (explaining how capitation only exacerbates insurer cherry picking); see also Tom Baker and Peter Siegelman, Tontines for the Invincibles:
Third, the growing gap in life expectancy between rich and poor Americans strongly suggests that the care gap between the insured and the uninsured is growing as well.\textsuperscript{35}

Fourth, the aging of the population and the resulting increase in per capita costs of care as those suffering from the diseases of aging become a larger and larger share of the population—while very real—is not a primary driver of increased costs.\textsuperscript{36}

Instead, fifth, the principal driver of anticipated system-wide cost increases is the creation and deployment of additional medical care technologies and protocols. Physicians and insurers are the gatekeepers who decide when and how additional medical care technologies and protocols will be deployed\textsuperscript{37}.

II. THE LOGIC OF THE ACA

Thus the ACA is motivated by a desire to fix the two major deficiencies of the American health-care financing system measured against the yardstick of other OECD economies.

A. Dealing with the Problem of Uninsurance

The ACA proposes to address the problem of the uninsured's lack of access to affordable care by, first, a large expansion of the federal/state Medicaid program.\textsuperscript{38} This will definitely not reduce health care costs: providing 15 million people with financing so that they can go to the doctor

INTERN MED. 320 (1999); \textit{THOMAS BODENHEIMER ET AL., PRIMARY CARE PHYSICIANS SHOULD BE COORDINATORS, NOT GATEKEEPERS,} JAMA 281 (1999); \textit{Melvin Kirschner, I Am a Physician, Don't Call Me a Gatekeeper,} L.A. TIMES, Septe. 3, 1995 at http://articles.latimes.com/1995-09-03/local/me-41803_1_patient-care

more often is not a cost-reducing measure.

The ACA proposes, second, to address the problem of the middle class uninsured's inability to purchase affordable insurance by creating fifty state-specific health exchanges, each of which will increase bargaining power and mitigate adverse selection. The hope is that these reforms will increase competition in the health insurance markets by diminishing the bargaining power of large insurers vis-à-vis individuals and small groups. If successful, administrative costs will fall greatly once community rating and the individual mandate reduce the incentive to engage in the adverse selection arms race. Private health care costs will decline, as will government costs, to the extent that those purchasing health insurance on the exchanges or elsewhere benefit from the federal subsidy pool. But the exchanges and the federal subsidy pool will also make it possible for approximately 20 million more people to go to the doctor more often. Once again, providing millions of people with financing so that they can go to the doctor more often is not a cost-reducing measure.40

The cost-saving and deficit-reducing measures in the ACA are found elsewhere.

B. Reducing the Deficit: Revenues from the ACA

Nobody knows how effective the ACA will be. It depends on the details of implementation, the functioning of the health care market, and future changes that are unknowable. The CBO has, however, projected the impact of the ACA which serves as a useful baseline and starting point.41 We consider the CBO projections below.

39 Community rating requires health insurers offer every applicant in the pool the opportunity to purchase insurance at a uniform community-wide price. The opposite of community rating is found in products that are individually underwritten and individually priced. Uwe R. Reinhardt, Is ‘Community Rating” in Health Insurance Fair?, N.Y. TIMES, Jan. 1, 2010 at http://economixblogs.nytimes.com/2010/01/01/is-community-rating-in-health-insurance-fair/

One of the largest single projected effects of the ACA is a federal tax revenue increase of $600 billion per year by 2040.\textsuperscript{42} This increase is due to a substantial excise tax on “high cost” health insurance plans.\textsuperscript{43} This tax can be thought of as a partial reduction in the tax preference provided to employer-sponsored health insurance, a reduction that will grow over time.\textsuperscript{44} As of 2040, if the ACA is fully implemented, and if its tax provisions are not suspended, postponed, or moderated, only about half of the health care costs of those receiving employer-sponsored insurance will qualify for the current tax preference. The other half will then take the form of either employee out-of-pocket expenses or employer payments via vehicles that do not qualify for tax preference.\textsuperscript{45}

This substantial excise tax on “high cost” health insurance plans is projected by the CBO to powerfully reduce the share of the federal deficit attributable to the health care sector.\textsuperscript{46} The tax’s supporters hope that it will boost economic growth in other sectors by reducing the quantity of Treasury bonds issued by the government to cover its deficit.\textsuperscript{47} Households and businesses seeking to hold bonds will then find themselves with a powerful incentive to lend money to businesses seeking to improve efficiency and profitability through greater capital intensity, and that increased productive efficiency shows itself as faster economic growth

\begin{footnotesize}
\begin{itemize}
\item[42] See \textit{The 2010 Long-Term Budget Outlook}, CONG. BUDGET OFF. (June 2010, rev. August), at 61. \url{http://www.cbo.gov/doc.cfm?index=11579}.
\item[43] Note that the ACA’s “Cadillac Tax” excise tax on the excess costs high-cost health insurance plans does not begin to take effect until 2018. Jenny Gold, ‘Cadillac’ Insurance Plans Explained, KAISER HEALTH NEWS (Mar. 18, 2010), \url{http://www.kaiserhealthnews.org/Stories/2010/March/18/Cadillac-Tax-Explainer-Update.aspx}.
\item[44] For an argument about why it is very dangerous to eliminate the tax preference for employer-sponsored insurance at least until effective universal coverage has been established, see David M. Cutler, J. Bradford DeLong & Ann Marie Marciarille, \textit{Why Obama’s Health Plan Is Better}, WALL ST. J., Sept. 16, 2008, at A25.
\item[45] CONG. BUDGET OFF. informal communication with authors. Thus the “Cadillac” name of the excise tax on high-cost health plans is, in the long run, a misnomer. The tax starts out as a tax on “Cadillac” health insurance plans, but as costs rise over time the tax applies to a larger and larger share of Americans. It is unclear whether the legislative coalition needed to sustain this tax over the long run will maintain itself.
\item[46] It is the driver of the CBO’s projected reduction in the fifty-year fiscal gap from the 2.6% of GDP that it forecast in 2009 to the 0.8% of GDP that it forecast in 2010. See \textit{The 2010 Long-Term Budget Outlook}, CONG. BUDGET OFF. (June 2010, rev. August), at 61. \url{http://www.cbo.gov/doc.cfm?index=11579}.
\end{itemize}
\end{footnotesize}
outside the health-care sector.\textsuperscript{48} The magnitude of these economic consequences is greatly uncertain and a matter of political dispute.\textsuperscript{49} By convention, the CBO does not take these possible changes in economic growth into account in its projections.

This substantial excise tax on “high cost” health insurance plans does create some incentives for private insurers to “bend the health care cost curve” directly. Formerly, insurance companies that devoted additional resources to marketing rather than cost control might well have found their profits increasing as a smaller proportional margin of prices over costs was spread out over a larger customer base. Once the excise tax on “high cost” health insurance plans has gone into effect, however, failure to control costs would be heavily taxed.\textsuperscript{50} It would be more profitable to devote corporate resources to cost control rather than marketing in order to keep premiums below the cap at which the tax begins to bind.

\section*{C. Bending the Medicare Cost Curve through the IPAB}

But the major projected bending of the health-care cost curve comes elsewhere in the ACA. The individual mandate prevents insurance companies from charging some households higher premiums while inducing other households to “go naked” without health insurance, to boost insurer profitability via adverse selection.\textsuperscript{51} Such business practices come at the price of very high administrative costs. The ACA will eliminate them.\textsuperscript{52} This will bend the cost curve as far as the private insurance market

\textsuperscript{50} If, indeed, the failure to control costs is the source of variation in health plan premiums. There is some evidence that only some of the variation in cost of family coverage can be explained by actuarial value of the plan. Jon Gabel et al., \textit{Taxing Cadillac Health Plans May Produce Chevy Results}, 29 HEALTH AFF. 1, 5 (2010).
\textsuperscript{52} The importance of the individual mandate to acquire coverage is as a centerpiece of any cost-growth reduction strategy. See Matthew Buettgens, et al., \textit{Why the Individual Mandate Matters: Timely Analysis of Immediate Health Policy Issues}, URB. INST. 3, 6-7 (Dec. 20, 2010), \url{http://www.urban.org/UploadedPDF/412280-individual-mandate-matters.pdf} (illustrating that, without an individual mandate, the ACA would still cut the
But, more importantly, the ACA through the IPAB is intended, and projected, to alter Medicare. The IPAB’s first major task is to alter the process by which Medicare sets reimbursement rates. Thus, through the IPAB, the ACA is an experiment in binding ourselves to socially-optimal Medicare payment decisions by removing much of Congress’s discretion on these matters.

The stakes are high. The long-run effects of the IPAB are projected to be enormous. This extraordinarily ambitious attempt to reform Medicare physician payments will serve as an object lesson, demonstrating the incredible tension between collective overconsumption and overspending on the one hand, and less-than-socially-optimized individual choices on the other. Consumers tend to recognize the need for rational decision-making on Medicare spending allocation, at least until confronted with their own denial of Medicare specialty services. Specialty physicians align their interests with those of Medicare beneficiaries scared of being denied, in what Tom Daschle described as the “patient-provider pincer movement” which is designed to maximize Medicare resources for those specialists. The role of specialty physician payments in fueling Medicare cost inflation and the role of specialty physicians in shaping Medicare health care delivery and outcomes reveal the strengths and weaknesses of trying to reform our hybrid health care system.

III. THE INDEPENDENT PAYMENT ADVISORY BOARD

A. Origins of the IPAB

The IPAB is designed as an independent, executive branch board directed to recommend savings for Medicare if the per capita growth in Medicare spending exceeds defined target growth rates. These target

---

55 During its first five years, if overall medical inflation does not exceed general inflation, IPAB may not issue binding proposals but it may issue advisory recommendations. Thereafter, IPAB must issue proposals if Medicare costs per beneficiary grow faster than one percentage point per year plus GDP per capita, and may not if they do not. James
growth rates are designed to bring Medicare’s growth rate in line with general inflation rates.

The IPAB’s scope of authority includes the mandate to issue recommendations to Congress to reduce Medicare’s spending growth rate. These recommendations are then fast-tracked for Congressional consideration. If Congress does not act in a timely fashion, the recommendations must be implemented by the Secretary of Health and Human Services (HHS). The IPAB’s provider targets go into effect in 2020, but exclude acute care hospitals. Various terms like “recusal legislation,” governance by “self-abnegation,” and “statutory entrenchment,” the IPAB’s default authority is the source of its power.

Medicare is a creation of Congress and has been governed as such since its inception in 1966. The governance process for Medicare has always been intensely political. Congressional architects of America's health care policy have long feared Congress's technical incompetence to deal with the highly complex issues of health care spending. To help deal with these issues, Congress thus created and has relied on its own highly-respected advisory body—the Medicare Payment Advisory Commission (MedPAC).

MedPAC resulted from the merger of the Prospective Payment Assessment Commission and the Physician Payment Review Commission in 1997. PPRC was established in 1985 to advise Congress on ways to
adapt or replace the system used to pay for physician services with a prospective payment system. Congress was the agent of physician payment reform, however, and PPRC merely offered analysis and advice on the scope and pace of implementation of physician payment system reform.\(^6^2\)

MedPAC has maintained its credibility, but it has always been an advisory body, lacking real authority. When push comes to shove, those whom its recommendations would disadvantage have lobbied Congress, and its recommendations for Medicare system rationalization and cost saving have not been implemented.\(^6^3\)

In the summer of 2009, both Senator Jay Rockefeller and the Office of Management and Budget Director, Peter Orszag, proposed to strengthen MedPAC by making it into an executive branch commission with specific savings targets and authority, not just to make recommendations to Congress (which Congress would then ignore), but to initiate action. Their proposals became what is now the IPAB: an independent board in the executive branch, consisting of fifteen members appointed by the President with the advice and consent of the Senate. The IPAB members cannot engage in any other employment; thus they cannot be otherwise-employed members of the health policy community. Given the enemies that the IPAB’s cost-cutting recommendations are likely to make in the provider and insurance communities, members of the board are not likely to be employed in the future by providers or insurers. An appointment to the IPAB is thus likely to be a career-ending, capstone position, at least for those of its members pursuing careers in health care finance.\(^6^4\)

The IPAB represents the latest, and strongest, iteration of an independent, expert panel dedicated to reducing the per capita rate of growth in Medicare spending. Created by the ACA as the watchdog of target growth rates for Medicare, the IPAB will spring to life in 2012. Based on the assumption that Congress and the federal administrative agencies have proven themselves too accommodating to the provider, payor, and consumer forces that propel an ever-increasing Medicare

\(^6^3\) See Ebeler, *supra* note 51, at 3.

\(^6^4\) The simultaneous requirements of substantive expertise and restrictions on other income-producing activity may help to account for the lack of nominees to date. Alternatively, it may make no sense to even attempt an appointment until the fate of the ACA is resolved at the Supreme Court. *The Independent Payment Advisory Board*, HEALTH AFFAIRS POLICY BRIEF (2011) at www.healthaffairs.org/healthpolicybriefs/.../healthpolicybrief_59.pdf
spending growth rate, the IPAB is designed to limit the growth of Medicare spending as well as improve the governance structure for Medicare.\footnote{Health Affairs Policy Brief, supra note 60.}

Demonstrating what Henry Aaron has called the “legislative statesmanship” of “self-abnegation,”\footnote{Aaron, supra note 3, at 2377.} Congress has insulated the IPAB from legislative intrusiveness\footnote{See id. at 2377-78.} as well as from constituent influence.\footnote{Steve Benen, The Independent Advisory Board Comes Under Fire, Wash. Monthly (Apr. 20, 2011, 12:30 PM), http://www.washingtonmonthly.com/archives/individual/2011_04/029035.php.}

B. The Operation of IPAB

The ACA sets target growth rates for Medicare spending beginning in 2014.\footnote{For 2015 through 2019, Medicare spending per capita’s target is the average of general and medical inflation. Brad Vaida, The IPAB: How Could It Change Medicare?, KAISER HEALTH NEWS (May 8, 2008), http://www.kaiserhealthnews.org/Stories/2011/May/09/IPAB-faq.aspx. For 2020 and later, the target is the gross domestic product plus one percentage point, though the President has floated a proposal to tighten IPAB’s target in later years to GDP plus 0.5 percentage point. Id.} These growth rate targets serve as triggers for IPAB’s authority to submit specific Medicare savings recommendations to Congress—but they are more than mere “recommendations” that Congress will then ignore.
Congress must respond or else the proposals automatically go into effect.\textsuperscript{73}

By the force of default implementation,\textsuperscript{74} the IPAB’s assignment is clearly to tame Medicare outpatient spending growth,\textsuperscript{75} and bring it in line with general inflation rates while also maintaining or enhancing Medicare beneficiary access to quality care. The goal is not to cap Medicare’s spending growth rate so as to align it with general inflation rates, but rather right-size it relative to other sectors of the economy.\textsuperscript{76}

For 2015 to 2019, the target growth rate for Medicare spending per capita is the average of overall inflation and medical inflation.\textsuperscript{77} Thereafter the target is one percentage point more than the per capita GDP growth rate. Every year, the Centers for Medicare and Medicaid Services (CMS) Actuary must determine whether the Medicare growth rate is exceeding the target growth rate. If it is, the IPAB is required to develop and submit a proposal to bring Medicare spending growth below the target rate.\textsuperscript{78}

The IPAB must submit its annual proposal for reducing Medicare spending growth by January 15. If it fails to do so, the Secretary of HHS must submit a proposal meeting the requirements by January 25. In either event, the Secretary must transmit and MedPAC must comment on the the IPAB proposal by March 1, after which the proposal is considered by Congress.\textsuperscript{79} In the event Congress does not act on the proposal, the Secretary of HHS is required to implement the recommendations for the

\textsuperscript{73} 42 USC § 1395kkk(b)(3) (2010).
\textsuperscript{74} See Ebeler, supra note 51, at 9.
\textsuperscript{75} ACA’s exclusions of inpatient and outpatient acute care hospital services, inpatient rehabilitation, psychiatric facilities, long-term care hospitals, and hospices from IPAB scrutiny until 2020 leaves the focus of immediate IPAB scrutiny on Medicare Advantage, Medicare Part D, skilled nursing facilities, home health, dialysis, ambulance, ambulatory surgical center services, and durable medical equipment. Id. at 10.
\textsuperscript{76} Id. at 3.
\textsuperscript{77} Id. at 6.
\textsuperscript{78} A technical note: ACA does not strictly require IPAB to recommend proposals to keep Medicare spending below target growth rates in all circumstances. Rather, it requires IPAB to reduce Medicare spending by the amount of the excess over the target only up to a specified percentage maximum that is unlikely to be reached. The fear is that should costs explode for some unknown reason, IPAB would then be forced by law into draconian and counterproductive economies. The Congressional architects of ACA seek to avoid that eventuality.
\textsuperscript{79} There has been very little discussion of the fact that the legislative language appears to grant the Secretary of Health and Human Services the powers and authority of the IPAB in the event that the IPAB itself deadlocks and fails to carry out its mission. The powers that Congress may delegate to an independent board are different than the powers Congress may delegate to a cabinet officer.
The tension between the IPAB’s obligation to monitor and master Medicare’s spending growth rate and its obligation to maintain or enhance beneficiary services is framed by the ACA’s limits on the IPAB’s authority. The IPAB may not recommend rationing of health care, raising Medicare beneficiary premiums, cost sharing, or modifying eligibility criteria. The joke that the IPAB is an acronym for “Death Panel” illustrates the concern and confusion over the IPAB’s statutory and regulatory role.\textsuperscript{81} The IPAB, as laid out in the ACA, is constrained in its choice of weapons to control Medicare spending growth.\textsuperscript{82} In addition, Medicare specifically withholds the power to regulate the practice of medicine from the federal government.\textsuperscript{83} All of this raises the question of whether the IPAB is too strong or not strong enough to accomplish its goal of bending the cost curve on Medicare cost inflation.

Congress must consider the IPAB’s proposals under special expedited procedures.\textsuperscript{84} The committees\textsuperscript{85} and the full House and Senate cannot consider any amendment that would change or repeal the Board's recommendations unless those changes meet the same fiscal targets that the IPAB met (however, three-fifths of Senators can override this restriction). The Senate must vote on the proposal by the end of no more than thirty

\textsuperscript{80}IPAB is prohibited from: (1) increasing Medicare cost sharing or premiums; (2) rationing health care; or (3) restricting benefits or modifying eligibility criteria. It cannot reduce payment rates for providers and suppliers below levels already specified elsewhere in ACA until 2020. In its first five years, therefore, IPAB is likely to focus on aspects of Medicare like durable medical equipment, dialysis, prescription drugs, Medicare Advantage, and home health. The savings that the CBO expects from the IPAB up until 2020 are thus not overwhelmingly large. Afterwards, however, the potential for major reforms greatly increases. See Ebeler, supra note 51, at 7-8, 10.

\textsuperscript{81} For example, see David Catron, \textit{IPAB Is an Acronym for 'Death Panel'}, \textsc{Amer. Spect.} (2011) http://spectator.org/archives/2011/04/22/ipab-is-an-acronym-for-death-p

\textsuperscript{82} See note 79.

\textsuperscript{84} 42 U.S.C. § 1395kkk(d)(4) (2010).

legislative hours. The Senate must vote on any conference report or amendment by the end of no more than ten legislative hours.

The ACA and the economic realities of Medicare spending have thus set the stage for the IPAB’s first major assignment. Its initial agenda cannot include Medicare inpatient services. Its agenda is limited to payments reform. Given that, the intersection of Medicare outpatient services and payment system reform is found at the Medicare Physician Fee Schedule. This makes it likely that the IPAB, at its launch, will focus on the Medicare Physician Fee Schedule. The key question is how the IPAB might wield its power to tame Medicare spending growth.

V. THE IPAB AND THE MEDICARE PHYSICIAN FEE SCHEDULE

A. The Importance of the Medicare Physician Fee Schedule

The architects of the ACA designed the IPAB to undertake reforming Medicare’s Physician Fee Schedule as a stepping stone to overall value-based payment reform. Migration of the health care financing system to value-based payment will be neither easy nor quick. Value-based payment systems in the future are likely to build on the current Medicare Physician Fee Schedule; the current reimbursement practices are the most obvious place to start. It is one of the few places where the stakes are large enough to bend the health care inflation cost curve.

The ACA proposes to slow Medicare spending growth through a comprehensive implementation of Medicare’s prospective payment system in the realm of physician services through the efforts of the IPAB. As Gerard Anderson et al. observed, “[a]lthough the huge federal Medicare program . . . possess[es] some monopsonistic purchasing power . . . the highly fragmented buy side of the U.S. health system is relatively weak.”

---

86 The thirty-hour decision deadline is tolled by the delivery of IPAB’s formal recommendations from HHS to Congress. Id. at 13-14.
87 Congress has reserved to itself the opportunity for a one-time fast-track joint resolution to dissolve IPAB in January of 2017. Dissolving IPAB via fast-track requires: (a) passage by August 15, 2017; and (b) the votes of three-fifths of members in the House and Senate. Id. at 9, 16-19.
89 Gerard F. Anderson et al., It’s the Prices, Stupid: Why the United States is so Different from Other Countries, 22 HEALTH AFF. 89, 102 (2003).
The IPAB’s assignment is to harness some of the monopsonistic purchasing power of the federal Medicare program by reworking physician payment standards. What role might the IPAB might play in the near-term revision of the Medicare Physician Fee Schedule? What limits are there to the IPAB’s capacity to rapidly take action to bend the cost curve on health care inflation?

Curtailing Medicare spending growth is not a novel goal. But past efforts to contain Medicare spending growth on physician services have been notably less successful than, for example, efforts to contain Medicare spending growth for inpatient hospital services.  

Medicare operates on a system of administered pricing that, with varying degrees of success, has most recently attempted to slow spending growth by the use of prospective payment systems. Although much-maligned, Medicare’s prospective payment systems have had some success in slowing Medicare spending growth for inpatient services, transitory success in slowing Medicare spending growth for post-acute care, and little success in slowing Medicare spending growth for physician services. It is worth understanding why the effectiveness of Medicare’s prospective payment system has been particularly blunted in the areas of physician services. The question is complex, as is the answer. But it is worth asking because it is Medicare’s prospective payment system that has been most effective at slowing Medicare spending growth—not managed care, not changes in cost-sharing, and not industry-sponsored voluntary efforts.  

Why are Medicare physician services the lynchpin to slowing Medicare spending growth? First, a large percentage of health costs are within the discretionary control of physicians, and the average primary care physician’s discretionary referrals display tremendous geographic and

---

91 Id. at 795-96.
92 Id. at 796-97.
93 Id.
94 Id. at 793; Stuart Guterman et al., Using Medicare Payment Policy to Transform the Health System: A Framework for Improving Performance, 28 HEALTH AFF. w239 (2009).
95 Brenda Sirovich, et al, Discretionary Decision Making By Primary Care Physicians and the Cost of United States Health Care, 27 HEALTH AFFAIRS 813 (2008).
practice context variance. If Medicare does not control the volume of spending physicians direct, Medicare will find it difficult to tame costs. Second, despite a substantial body of empirical analysis on the control physicians exercise over discretionary health care spending, Medicare physician payments have not been trending downward. Finally, the failure to give physicians who participate in Medicare a financial and performance stake in efforts to control Medicare spending has left those most able to “bend the cost curve” on Medicare spending growth outside the circle of interest and power capable of exerting this control.

B. What Is the Problem to Which the IPAB Is the Solution?

The IPAB is designed as an independent fifteen-member board of the executive branch. The IPAB’s members, most importantly, are to be full-time federal employees excluded from outside employment, and paid the salary of senior executives in the federal government. Each member will be a presidential appointee with relevant expertise in health care, health economics, health research and technology, health insurance, and employer sponsors of health insurance. The President is required to seek the advice and consent of various Congressional leaders in making twelve of these appointments, but retains exclusive authority over three of these six year appointments.

96 Howard Brody, Medicine’s Ethical Responsibility for Health Care Reform, NEJM 262 (2010).
99 These individuals are properly referred to as physicians who “accept Medicare assignment.” 42 C.F.R. § 414.50(b)(2) (2009).
Given the duration of the exclusive service requirement, service on the IPAB might have to be seen as a career capstone project. Limiting likely service on the IPAB to those at the end of their career narrows the field of potential appointees.\textsuperscript{103}

The purpose of excluding outside employment is obviously to avoid any conflict of interest, though why prior service and retirement packages comprised of investment holdings in the entity are not a problem is a mystery. The purpose of the lengthy term of service is to send a strong message about the lack of revolving door opportunities for the IPAB appointees. Willingness to serve (or lack thereof) under such stringent limitations will only become evident as the program is implemented.

\textit{C. IPAB: Can it Work?}

Because Medicare physician payments are so huge, it is tempting to assume they are too large. But do we actually overpay for Medicare physician services? To answer this we need to understand how Medicare pays for physician services, how commercial insurance pays for physician services, and the perverse relationship between the two.

\textbf{1. The Sustainable Growth Rate Formula}

Earlier attempts have been made to tether the growth of Medicare physician payments to GDP growth. Dating from the early 1990s, the “much hated”\textsuperscript{104} sustainable growth rate (SGR) formula has hovered over Medicare physician payment for decades. The SGR formula requires cuts in Medicare reimbursements if total Medicare payments to physicians exceed GDP growth by a certain amount.

However, SGR has never been implemented because Congress is, and has been, unwilling to lower fees for all services.\(^{105}\) The attraction of adjusting physician payments “with a scalpel”\(^{106}\) is that some physician services are overpaid while others do not even cover their costs. The challenge is to reduce the overvalued, raise the undervalued, and do it all with a budget neutral outcome.\(^{107}\) To attempt to gain the expertise necessary to accomplish this task, Congress established MedPAC.

MedPAC is and always has been an exclusively advisory body.\(^{108}\) Established by the Balanced Budget Act of 1997, MedPAC was designed to advise Congress on fee-for-service Medicare payment systems in addition to analyzing access and quality of care issues. MedPAC has seventeen members who serve three year renewable terms on a part time basis. They are appointed by the Comptroller General.\(^{109}\) MedPAC issues two reports—March and June each year—to publicize its recommendations.\(^{110}\)

2. Will IPAB Do Better than MedPAC?

In contrast to the “oft-ignored” MedPAC,\(^{111}\) the IPAB is designed to

\(^{105}\) Id.
\(^{106}\) Id.
\(^{107}\) The relationship between Medicare payment system reform and the institutionalization of comparative effectiveness concerns into Medicare has made IPAB a controversial entity. IPAB’s broader portfolio of responsibilities raises the question of whether IPAB represent the introduction of command and control regulation into health care, where it is rarely found. If the broader scope of responsibility makes IPAB a comparative effectiveness agency as much as a Medicare payment system reform entity, ought it not be explicitly acknowledged as such?

\(^{108}\) Senator Jay Rockefeller introduced legislation to transform MedPAC into an independent executive agency, modeled on the Federal Reserve Board, in May of 2009. Other failed proposals, including one from Senator Tom Daschle, were to create a health Fed designed to reach far beyond Medicare. Laura Yao, *MedPAC is Primed for Bigger Role in Health-Care Overhaul*, WALL ST. J. HEALTH BLOG (June 3, 2009, 4:54 PM), http://blogs.wsj.com/health/2009/06/03/medpac-is-primed-for-bigger-role-in-health-care-overhaul.

\(^{110}\) See Documents, MEDPAC, http://www.medpac.gov/documents.cfm (last visited Nov. 8, 2011) (select “Reports” in the “Document Type” field), for these reports.

demand Congressional attention. Its recommendations become law unless the House and the Senate adopt resolutions to block them. The default impact on the Medicare entitlement program will empower IPAB. Rather than proposing alternatives to the Medicare fee-for-service status quo, IPAB will drive the dimensions of the status quo. Congress must take affirmative action to derail IPAB’s power, if it wishes.

MedPAC was not abolished by the ACA, however. Nor is the IPAB going to be a super-MedPAC. MedPAC’s mandate to review the global health care system is not replicated in the IPAB. MedPAC also has substantial expertise to offer. MedPAC’s staff and expertise are so valued, in fact, that MedPAC lives on under the ACA as the Congressional advisory body that will review the IPAB’s recommendations. Whether or not the two entities will work in tandem or at odds, for the foreseeable future they will co-exist, one with the default authority to set Medicare payment policy and the other with the mandate to advise Congress as to the wisdom of these policy proposals. It is ironic that MedPAC’s most forceful role yet may be as Congressional advisor on the IPAB.

3. IPAB’s Governance

IPAB’s governance and policy structure can be seen as a hybrid of three previous attempts by Congress to tie itself to the mast and so reduce political interference with extremely knotty and important, but ultimately technocratic questions. These attempts resulted in the creation of the Federal Reserve Board (Fed), the Securities and Exchange Commission (SEC), and the Defense Base Closure and Realignment Commission (BRAC).

---

BRAC’s process began with published selection criteria for military base closures, Secretary of Defense recommendations to the independent commission, commission study (including public input) of these recommendations, and ultimately, commission recommendations to the President. Like IPAB, Congress had a brief window of opportunity to act on the commission’s report (on an all or nothing basis) before the commission’s realignment and closure recommendations became law. Although the IPAB’s scope of authority is limited and based on a staged rollout, its decision-making structure is similarly designed to be insulated from external influence.

The insight that “[e]veryone wants to lower costs until someone tries to lower costs” could not be more applicable to the IPAB or to Medicare reform in general. Whether the IPAB can deliver what has been described as the framework for “learning to say no” will be its biggest challenge. Although it is often thought that Medicare beneficiaries most need to learn this lesson, it is likely the IPAB will have to deliver the message first to Medicare providers.

V. THE IPAB’S INITIAL PRINCIPLE ASSIGNMENT

A. Relative Value Units

It is significant that the scope of the IPAB’s authority and the staging of its rollout combine to focus its first task on outpatient physician services. Physician services billed to Part B account for about 13 percent of all Medicare spending. Medicare uses a physician fee schedule to determine physician payment rates. Values are assigned based on the amount of work required for a listed service, the expenses related to maintaining a practice, and liability insurance costs.

115 42 USC § 1395kkk(b)(3) (2010).
116  Benen, supra note 64.
118  Demand driven overconsumption by Medicare beneficiaries is traced to the moral hazard inherent in all insurance coverage and amplified by the substantial impact of Medicare secondary insurance (“Medigap”). See David M. Zimmer, The Relationship Between Medicare Supplemental Insurance and Health-Care Spending: Selection Across Multiple Dimensions, E. ECON. J. 1 (2011) (advance copy).
120  Geographic adjustments reflecting regional differences in wages, rent and other costs
Payments are updated yearly under the SGR formula, designed to keep Medicare spending growth “consistent with growth in the national economy.” The ACA establishes specific target growth rates for Medicare and appoints the IPAB the guardian of those goals. Just as physician conduct defeated the promise of the Resource-Based Relative Value Scale (RBRVS) discussed below, by raising the volume of services provided, Medicare Volume Performance Standards (VPS) have attempted to address increased Medicare physician service volumes, as to both frequency and intensity of services. Physician payment system reform has repeatedly and sequentially vacillated between a focus on expenditures and a focus on costs without acknowledging the relationship between the two.

Relative weights or relative value units (RVUs) are the core of the Medicare Physician Fee Schedule. RVUs are designed to account for the relative costliness of resources used to provide each service and reflect the relative levels of time, effort, skill, and stress involved. Physician services, in short, have been distilled to these components: time, effort, skill, and stress. The origins of assigning relative weights to physician effort and skill trace back to the invention of RBRVS. Harvard Medical School Professor William Hsiao rationalized the most common Medicare physician services in a kind of medical time study, based on his understanding of the time, effort, skill and stress involved in these services in 1992. These relative weights are updated at least every five years. As reported by MedPAC, “in completing its review, CMS receives advice from a group of physicians and other professionals sponsored by the American

---

121 Congress has regularly specified an update outside of the SGR formula. Physician Services Payment System, supra note 93, at 1.
Medical Association and physician specialty societies.\textsuperscript{127}

William Hsiao’s legacy is a system that systematically undervalues cognitive services, and systematically overvalues medical procedures.\textsuperscript{128} As a result, specialty physician services enjoy continued dominance in the delivery and budget of the Medicare program.

At this point, one would expect an authorial team including an economist to sneer in Hayekian fashion at thumb-fingered government regulatory bureaucracies. Government is one-size fits all and cannot process detailed information; private actors in markets are more efficient and flexible, economists might say. They must, under pressure of competition, create better ways of classifying expenditures and reimbursing providers than the rigid command-and-control accounting system of Dr. William Hsiao.\textsuperscript{129}

If the economist co-author were to say this, however, he would be wrong. It is a fact that the bulk of private insurers use Dr. Hsiao’s work and the RVS as a baseline against which to make their own pricing and reimbursement decisions.\textsuperscript{130} The market cannot magically create information out of thin air. It has to be created by somebody, somewhere—and that somebody is Medicare. As the largest paying unit in America’s health care system, it would be surprising if Medicare did not turn out to be both the price and the administrative process leader whose judgments are taken as a baseline that other purchasers use in making their own pricing and reimbursement decisions.\textsuperscript{131}

\textbf{B. The RVS Update Committee}

The AMA and several national medical specialty societies created the AMA/Specialty Society RVS Update Committee (RUC) to inject its

\textsuperscript{127} \textit{Physician Services Payment System, supra} note 93, at 3.
expertise into the RBRVS payment system review process. But it has not been without controversy. MedPAC’s March 2010 report to Congress recommended limiting Medicare’s unit prices, and the ACA requires HHS to periodically review these relative codes with special attention to potentially “mis-valued” codes. This is because CMS has shown tremendous deference to RUC recommendations. RUC’s recommendations are accepted by CMS 94 percent of the time. Anything that disturbs the order of this will be world-view changing.

CMS’s deference to RUC does not come after a long experiment with command and control regulation tempered by the acknowledgment that self-regulation may prove the wiser course. The RUC has been captured since its inception. If capture represents a regulated industry dominating the creation and enforcement of a regulation, then the establishment and operation of RUC embodies capture of a more nuanced type. Here we have capture of the out patient physician payment schedule by one group of providers to the exclusion of others. Yet RUC is a poster child for how secret, unmonitored self-regulation does not manifest the upside of capture, where voluntary compliance improves regulatory outcomes.

It has been observed that “[a]lthough some consider the volume-generating incentives of current payment systems so perverse that they would not spend much time correcting existing mispriced values . . . it will

137 Report 14 of the American Medical Association Board of Trustees (August, 2008), The RUC: Recent Activities to Improve the Valuation of Primary Care Services at www.ama-assn.org/resources/doc/rbrvs/rucbotreport.pdf (“The original intent was to include all major specialities, primarily defined as the 24 Member Boards of the American Board of Medical Specialties.”)
be necessary to correct mispricing and other flaws in existing fee-for-service payment systems in order to ultimately dismantle them. 140 Indeed, if we do not assess and correct for the contribution of over-valued services to Medicare’s cost-inflation, we run the risk of building the same defects into any future Medicare payment and delivery system. The kind of morphic resonance 141 that leads us to design a system that systematically undervalues the services we should value the most will require a thorough morphology to avoid replication. IPAB’s assignment to consider RUC’s contribution to medical inflation, as a result, is both medically and politically freighted.142

C. Why Medicare Physician Reimbursement Relative Value Units Should Matter to IPAB

Medicare’s relative value scale is the foundation of the Medicare physician fee schedule. The roughly 7,000 RVUs in Medicare’s relative value scale are supposed to reflect true relative practices costs. 143 Rapid advances in medical technology require RVU adjustments over time. 144 The RBRVS determines prices based on physician work (52 percent), practice expense (44 percent), and malpractice expense (4 percent). Although all of the RBRVS components are contentious, 145 CMS relies heavily on RUC to assist it with this task. 146 RUC is a group of twenty-nine physicians drawn from a variety of medical specialties. Specifically, RUC is composed of a chair, six AMA committee representatives, and twenty-

140 Berenson, supra note 102, at 103.
142 See Berenson, supra note 102, at 102.
144 Id.
three members at large.\textsuperscript{147}

When RUC was first formed, representatives were requested from each of the specialties within the American Board of Medical Specialties, except for neurology.\textsuperscript{148} Medical specialties have evolved significantly since that time. Although neurology is now represented on RUC, geriatricians, oncologists, and gastroenterologists are now excluded from RUC seats. Neurology’s later addition is consistent with neurology’s transformation from a patient-oriented to a procedure-oriented focus.\textsuperscript{149} As each specialty delegate’s vote is limited to one equally weighted seat, the valuation of the work of all physicians is set by physicians almost entirely outside of the relevant specialty.\textsuperscript{150} Inevitably, patient-oriented services are systematically devalued. The vast majority of voting status representatives on RUC are procedural- or surgery-focused specialties.\textsuperscript{151} Medicare requires that all RUC relative value adjustments be budget-neutral as well.\textsuperscript{152}

RUC, in short, pits representatives of “face time” or evaluation- and management-intensive providers against procedure-driven providers in the division of the Medicare physician fee schedule pie. The very composition of RUC favors providers of invasive, high-technology procedures over primary care and cognitive medicine providers. This outcome was predicted at RUC’s founding because of the rise of “lucrative outpatient diagnostic studies” as a growth sector.\textsuperscript{153} This prediction has been particularly prescient. Entire medical specialties—such as family practitioners and geriatricians—do few high-technology procedures, the \textit{sine qua non} of relative value in the Medicare Physician Fee Schedule. Ironically, it is these same evaluation- and management-intensive primary care providers that approve or direct significant amounts in health care spending per work

\textsuperscript{150}Medical specialties with RUC voting status include: anesthesiology, cardiology, colon and rectal surgery, dermatology, emergency medicine, family medicine, general surgery, internal medicine, nephrology, neurology, neurosurgery, obstetrics/gynecology, ophthalmology, orthopedic surgery, otolaryngology, pathology, pediatrics, plastic surgery, pulmonary medicine, psychiatry, radiology, thoracic surgery, and urology. \textit{Id.} at 21.

\textsuperscript{151}\textit{Id.} at 20.

\textsuperscript{153}Waxman, \textit{supra} note 136 at 21 (quoting Dr. Bruce Sigsbee, first representative of the American Academy of Neurology to the RUC).
The current chair of RUC explains the weighting of procedural over cognitive specialties by noting that RUC was never meant to be a representative body. Although this rationale has been met with considerable scorn by primary care physicians, it contains more than a kernel of truth. Primary care physicians bemoan their exclusion from RUC and the fact that each seat is filled by a physician who acts as an advocate for a given specialty. Nevertheless, the lessons that can be extracted from RUC’s “failed experiment” are substantial.

Specialty physicians dominate the RUC. This has significance for both Medicare cost inflation and care delivery. American medicine is specialty physician dominated, with primary care physicians comprising less than half of the total physician group. By contrast, virtually all European countries have a broad generalist physician foundation comprising 70-80 percent of all practicing physicians. The conventional explanation for the primary care and specialty physician distribution in the United States is that primary care is underpaid and undervalued, and the mechanisms by which these perverse outcomes are institutionalized are rarely scrutinized. Without such scrutiny, it is hard to know how a system that rightly values the most efficient Medicare physician services can be implemented.

RUC offers a vivid example of how administered pricing schemes can be captured by those who would benefit from overpayments. It has

162 Frank Pasquale, RUC’s Role in Medicare, BALKINIZATION (Oct. 27, 2010, 1:30 PM),
also been suggested that RBRVS is destined to produce mis-valued codes and that overvalued codes will always lead to spending growth. If this is true, the problem with health care overconsumption and overpayment is larger than the problem of Medicare physician payment. If it is also true that an estimated 30 percent of health care services are unnecessary or duplicative, it is worth considering how to wring the most obvious inefficiencies out of the system. Reforming RUC would be an excellent place to start.

D. Reforming RUC

CMS has been urged to seek independence from RUC when recalibrating RVUs. MedPAC has recommended that an independent body of experts, composed of a group extending beyond physicians to economists and third-party payers, review RUC recommendations. It has also been suggested that the IPAB play this role. These recommendations, of course, assume that the difficulties of government central planning in health care markets would be remedied by a differently-composed RUC alone.

Reformulating RUC would also have significant implications for inpatient care. Just as outpatient Medicare physician services have been shaped by RUC’s role in recalibrating RVU’s, acute care hospitals have oriented much of their service provision toward high value RVUs and high value RVU specialty groups such as cardiology.

RUC operates in substantial obscurity. Although the identity of RUC appointees is available within the AMA, this information has not been widely circulated. In addition to being disproportionately oriented towards procedural medical specialties, RUC’s current appointees are

163 Reinhardt, supra note 130.
164 Id.
165 Id.
167 Reinhardt, supra note 130.
168 Id.
169 The AMA’s website does not list RUC membership by name, for example.
disproportionately male and southern. In addition, almost half of the members of RUC have financial relationships with pharmaceutical companies, biotechnology companies, device companies, health care providers, and health insurance companies. Nevertheless, the AMA asserts that RUC members “exercise their independent judgment and are not advocates for their specialty.” The effect of bias is difficult to measure since RUC’s votes are confidential. RUC is reported to have a conflict of interest policy, although it is unknown. The meetings are closed, but CMS is reported to have observers at each meeting.

The single most important thing to know about RUC is that it has used “flawed and capricious methodologies” to produce a system that is itself fundamentally flawed. These flaws harm both patients and taxpayers. Not coincidentally, they also harm primary care providers and purchasers. The second most important thing to know about RUC is that it develops new RVUs, and CMS approves them. Historically, it has taken several years to develop and value new codes. Needless to say, RUC moves slowly.

RUC serves providers poorly, yet it not been abandoned by providers. This is because RUC serves certain providers very well, and only disserves primary care providers. The largest primary care medical society, the American Academy of Family Physicians (AAFP), is currently studying the implications of abandoning RUC. The potentially-

---

170 A current list of current RUC membership and affiliation is most readily accessed through non-AMA sources. See e.g., http://careandcost.com/2011/04/28/conflicts-of-interests-among-the-rucs-members/.
173 Id.
174 RUC’s proprietary meetings are reported to be closed to members of the public, except by invitation of the chair. http://careandcost.com/2011/02/26/replace-the-ruc-2/
177 Id. at 6.
destabilizing effect of such a decision by an entity representing roughly 10 percent of the country’s primary care providers cannot be ignored. AAFP’s New Jersey and Florida chapters have already called for the AAFP to quit RUC.\(^\text{179}\)

Most recently, a Maryland-based group of primary care physicians has brought suit against CMS for ceding control of the Secretary’s rulemaking process to RUC and for failing to properly constitute the RUC as a Federal Advisory Committee.\(^\text{180}\) Although the case has only recently been filed, review of CMS’s 12(b)(6) motion indicates that CMS takes the position that RUC is a creature of the AMA and not a federal advisory committee.\(^\text{181}\) It remains to be seen whether the most significant byproduct of this litigation will be an airing of RUC’s operation. What is clear is that CMS appears unwilling to cede ground on their position that the Medicare statute does not permit either administrative or judicial review of the determination of relative values.\(^\text{182}\)

Although primary care physician distaste for RUC is apparent, it is rarely noted that RUC also serves patients poorly, though it has not been attacked by patients. This is because few patients understand RUC and the implications of its valuation of physician services for the quality, quantity, and cost of care that they receive. Also, patients are the ultimate end-users of health care in our hybrid system. As such, they are also often insulated from cost and a comprehensive understanding of health care cost drivers.

If RUC serves payors so poorly, why has it not been abandoned? Payors, including the biggest payor of them all, the United States government, have been reluctant to abandon RUC in light of the failure to identify a clearly superior alternative. RUC embodies many of the flaws of self-regulated fee-for-service medicine while also embodying the political stalemate over funding physician services through government-funded health insurance, leaving many persuaded that progress is impossible. In addition, primary care providers have not leveraged their role as the specialty care referral base into financial concessions from other

\(^\text{181}\) Id.

\(^\text{182}\) Id. Defendants’ Motion to Dismiss at 14.
Even the modest proposal that any medical services valuation panel include a broader array of health care experts (including non-provider experts) has met with ferocious criticism from providers. More ambitious proposals (e.g., requiring CMS to fund direct surveys of medical practice and resources) scarcely see the light of day.

It has become an anathema to mention financial incentives for physicians when discussing reform of payment for physician services under government funded health insurance. Yet, since physician decisions drive most health care costs, it is impossible to address physician payment without addressing physician motivation. As a result, in our public discourse we simply talk around the issue.

Unfortunately, continued specialty physician dominance of the physician services valuation system stifles the discourse about whether physician services are appropriately-valued and the larger discourse about self-regulation in government-funded health insurance. Given the current stalemate over how to proceed, we might learn from the stalemate that plagues the debate regarding acceptable growth rates for physician services payments.

E. The Physician Payment Sustainable Growth Rate Formula

Controls on aggregate Medicare physician spending have helped suppress the growth of Medicare costs over the last three decades. The staged introduction of Medicare’s prospective payment systems have demonstrated that spending growth is responsive to policy interventions,

---

183 Id.
184 Reinhardt, supra note 130.
185 See, e.g., Klepper, supra note 162.
187 Medicare’s excess growth or spending growth beyond what may be attributed to general economic growth is often referred to as Medicare inflation or Medicare’s growth rate. Bending the cost curve refers to the capacity to limit Medicare’s spending growth to what may be attributed to general economic growth. The Long-Term Outlook for Health-Care Spending, supra note 7. (last visited Oct. 26, 2011).
188 White, supra note 83 at 796-97.
189 Id. at 795-98.
but not all reforms have worked equally well in all settings. Excess spending growth in physician and clinical services has proven particularly intransigent.\(^{190}\) The story of why this is so—why excess Medicare spending growth in hospital care expenses has been tamed by changes in Medicare’s payment policies, and why excess Medicare spending growth in physician services has not—helps to explain the IPAB’s design and function. It is the story of the failure of Congress to implement Medicare’s SGR formula for Medicare physician services that helps to explain the IPAB’s impetus.

Congress has affirmatively refused to change the payment incentives for doctors, while acknowledging physician decisions drive most health care costs, because physicians have not embraced Medicare physician payment reform.\(^{191}\) Congress has now decided to take matters out of its own hands: “All Congress can do is fully replace an IPAB recommendation with a reform that saves the same amount of money or muster both a supermajority and a presidential signature to stop IPAB from acting. Either path requires a lot more effort than undermining cost control does right now.”\(^{192}\)

Ambivalent about physician reimbursement’s role in Medicare excess spending, Congress has intermittently frozen fee levels,\(^{193}\) reduced fees for certain procedures,\(^{194}\) and introduced a fee schedule with spending targets.\(^{195}\) Even more ambivalent about its role in keeping excess Medicare physician growth in check, Congress has overridden the fee schedule consistently and regularly since its introduction in 1992.\(^{196}\)

The SGR formula requires that if the growth of Medicare’s total payments to physicians exceeds GDP growth by a certain amount in a given year, reimbursements will decrease. Medicare adopted the SGR formula in

\(^{190}\) Id. at 796-97.

\(^{193}\) White, supra note 83, at 797.

\(^{194}\) Id.

\(^{195}\) Id. at 796-97.

the 1990’s as part of the Gingrich-Clinton balanced budget negotiations. However, the SGR did not begin to bind until 2003, when the growth of Medicare’s total benefits per beneficiary exceeded the growth rate of GDP per capita. Then the across-the-board cuts to physicians accepting Medicare assignments mandated by the SGR formula began to accumulate. Congress promptly postponed implementation of the SGR. Congress has yet to allow the SGR formula to kick in. Because the SGR formula cuts Medicare payments to all physicians—well-compensated or otherwise—it has raised concerns of reduced access to care for Medicare beneficiaries. And, because the SGR formula is a rallying cry for organized medicine’s fear of falling income and status, it has a perverse usefulness to its proponents and opponents alike. Unfortunately, “virtually everyone in Washington understands that the SGR formula will never be implemented.”

The cumulative unimplemented cuts are now projected to equal a 29.4 percent SGR cut in the Medicare physician growth rate. Acknowledging that a January 1, 2012 29.5 percent cut to Medicare physician payments would be detrimental to beneficiary access to care, MedPAC urged Congress to resolve the SGR formula conundrum. By October of 2011, MedPAC’s dissatisfaction with the SGR formula had escalated to the point of urging its repeal and replacement by a yearly schedule of specified updates for the physician fee schedule as well as a 17 percent across-the-board cut in Medicare specialty fees. But specialty physician pushback has been substantial.

In light of this, several options are now on the table. One option would be to embrace the 29.4 percent SGR-related cut to the Medicare physician growth rate. This would almost certainly cause some contraction in those physicians accepting Medicare assignment, but would likely not lead to the alarmist prediction of the wholesale collapse of Medicare

---

197 Mahar, supra note 81. See also A Plan to Fix the Draded SGR Formula? AM J OF MANAGED CARE (2011) at http://www.ajmc.com/focus-of-the-week/1011/sgr-focus-101711

Among private physicians, Medicare is the preferred payer, with about 93 percent of American physicians willing to accept Medicare beneficiaries as patients. Embracing the 29.4 percent SGR-related cut to the Medicare physician growth rate would mean Medicare might deepen its reputation as a less than optimal payor without harming its reputation as a reliable and, consequently, favored payor. If past is prologue, however, we are unlikely to have the chance to find out what such a significant cut to Medicare physician growth rate would mean for Medicare beneficiaries. This option is unpalatable to Congress.

A second option would, much as MedPac as only recently done, be to abandon the SGR formulation entirely and urge Congress to develop a revised physician payment system. Abandoning the SGR formulation would reduce provider interest in Medicare physician payment reform, however.

A third option would be to use the looming SGR-related cut to generate pressure to establish a new Medicare physician services payment system, an approach advanced by the National Commission on Fiscal Responsibility and Reform.

Instead, Congress has routinely overridden the SGR and MedPAC continues to spin out proposals to resolve the SGR formula dilemma, most recently no fewer than four potential fixes centered around simply repealing the SGR.

McClellan, Engleberg Center for Health Care Reform) (urging the Subcommittee to look beyond approaches that remain tied to the existing formula simply by delaying it again, or by resetting baselines to higher spending levels). See also, Abby Goonough and Kevin Sack, *Massachusetts Tries to Rein In Its Health Cost*, N.Y. Times, October 18, 2011, at A1 (“Those who led the 2006 effort to expand coverage readily acknowledged that they deferred the more daunting tasks of cost control for another day.”).
In the meantime, the ACA’s launch of the IPAB draws closer, in the face of a Constitutional challenge to its validity. This challenge, often hidden in the shadow of other Constitutional attacks on the ACA, merits some thought.

VI. CONSTITUTIONAL CHALLENGES TO IPAB

A. Separation of Powers

The IPAB’s lynchpin is the limitation of specialty physician control over discussions about Medicare physician reimbursement. This process is described disparagingly as “government of, by, and for supposedly disinterested experts,” and the IPAB’s mission is to insulate the conversation about cost effective Medicare reimbursement rates from specialty provider dominance. The IPAB’s operational model does, in fact, substitute one group of congressionally-authorized and executive branch-selected health care experts for the specialty physician experts who dominate RUC. Ultimately, both the status quo and the IPAB’s model involve extensive use of experts. The status quo unofficially delegates authority to specialty physicians through the RUC process and the ACA explicitly delegates authority to the IPAB.

Among the twenty-eight federal cases challenging the ACA, the Goldwater Institute’s Coons v. Geithner frames the separation of powers challenge to the IPAB’s organization around the broad authority delegated to the IPAB by Congress. Asserting that the ACA “provides almost no limit on and no intelligible standard constraining the exercise of legislative power by IPAB,” the complaint seeks to test the modern parameters of Supreme Court deference to Congressional delegation of authority.

Congressional authority to delegate power under broad general directives is recognized as necessary for Congress to resolve especially technical problems. The limit on Congressional authority to delegate lies in the requirement that Congress include an “intelligible principle” to guide

---

The IPAB’s statutory mandate is to find ways to “reduce the per capita rate of growth in Medicare spending.”\textsuperscript{213} This mandate is constrained by the requirements that the proposals be specific, focus on extending Medicare solvency, and protect and improve Medicare beneficiaries’ access to necessary and evidence-based items and services.\textsuperscript{214} The ACA’s guidance for the exercise of the IPAB’s discretion is substantial, substantially broader than the intelligible principle identified in the Emergency Price Control Act litigated in \textit{Yakus v. United States}. There, the Congressional mandate was to set prices at levels “generally fair and equitable,”\textsuperscript{215} with the specific parameters of discretion read into the statute from the legislative history.\textsuperscript{216} The substantial discretion granted to the Secretary of Health and Human Services in transforming the IPAB’s recommendations as they are forwarded to Congress raises questions about the permissible scope of the intelligible principle created to guide the conduct of the agent.\textsuperscript{217}

The IPAB’s authorizing legislation is remarkably detailed as to the limitations on its authority. It is these very detailed limitations that make IPAB’s task so daunting.\textsuperscript{218} In addition, the Supreme Court has shown remarkable deference to Congressional delegation of authority. The only two Supreme Court cases indicating federal statutes lacked the necessary intelligible principle to constrain board or agency action concerned delegations of authority lacking the ACA’s substantial limitations on IPAB authority.\textsuperscript{219} In addition, no law has been struck down under a delegation challenge since the 1930s.\textsuperscript{220} IPAB’s framers were careful to constrain its authority over matters beyond Medicare payment reform.

\textsuperscript{218}P.L. No. 89-97, \textit{supra} note 82.
VII. Conclusion

In order to blunt resistance to Medicare by physician interest groups, President Lyndon Johnson proposed a payments system for Medicare with minimal oversight: doctors would charge Medicare what they charged their other patients for the services that they, the doctors, deemed to be medically appropriate. But while private insurers and individuals paying out-of-pocket could, and did, inquire as to how appropriate and necessary the various procedures were, Medicare, as originally established, did not.

By the 1980s it was clear that if Medicare was to be sustained over the long run it needed more oversight of the payments system. The option chosen was Dr. William Hsiao’s “medical Taylorism”\(^{221}\): determine how much it ought to cost to treat this condition and perform this service—based on the locality and the time, effort, skill, and stress involved—and then base Medicare reimbursement rates on that determination. Once again, however, the system is out of balance. Just as insurance company regard for bottom lines and household regard for individual spending were missing from the original system, so too the current system overvalues specialty medical procedures, because specialists have the expertise, free time, and incentive to shape the process in their own interest.

The IPAB is designed to redress this imbalance. With publicly-announced membership and open procedures, the IPAB is designed to bring conversations over Medicare physician compensation into the public forum. The Obama administration is placing many of its long-run hopes for sustaining the social insurance system on the IPAB. Even though the IPAB will not to spring into existence until 2012, throughout 2011 the same principles governed President Obama’s federal health care spending control strategy: “by strengthening an independent commission of doctors, nurses, medical experts, and consumers who will look at all the evidence and recommend the best ways to reduce unnecessary spending while protecting

\(^{221}\) The term we coin in analogy to the Taylorist movement of the early twentieth century for the rationalization of industrial processes. See Frederick W. Taylor, The Principles of Scientific Management (1910) (“the self-evident fact that maximum prosperity can exist only as the result of the determined effort of each workman to turn out each day his largest possible day’s output”).
access to the services that seniors need.”

Expert boards have always run the risk of being captured by the industry that they are supposed to regulate. Indeed, the Medicare reimbursement process has already been captured, and the need to substitute an open and informed process for the RUC’s rubber-stamping of specialist-driven outpatient physician service valuation is great. The Medicare payment systems bellwether status means that commercial insurance consumers and payers would also benefit from bringing the discussion of the systematic over-valuation of specialty care and devaluation of primary care out into the open.

The ACA is peppered with programs designed to raise the status and value of primary care providers. But all of this will be for naught if primary care services are not properly validated and valued in Medicare.

---
