“If the free-market sector of the economy is allowed to develop under antitrust rules that are blind to all but economic concerns, the likely result will be an economy so dominated by a few corporate giants that it will be impossible for the state not to play a more intrusive role in economic affairs…” Robert Pitofsky, 1979

1. Introduction

This article examines whether, and the extent to which, antitrust law could contribute to a broader regulatory effort to control the too-big-to-fail problem. The article begins by exploring the nature of the problem. Against this backdrop, antitrust policy and rules are considered to evaluate whether antitrust might play a meaningful role. The article concludes that antitrust law, if vigorously enforced with attention paid to the need to avoid too-big-to-fail problems can be a useful public policy tool to address the problem, although it can come nowhere near solving it or preventing recurrences of recent systemic failures. The narrowed focus antitrust developed under the influence of the Chicago School greatly limits its potential utility in this context and it is worth serious reconsideration. Whatever contribution antitrust might make in resolving this public policy problem could be considerably greater if more robust rules consistent with the historic purposes of antitrust law were either enacted by Congress or forged by the judiciary to protect consumers against the output, innovation and price effects of catastrophic failures via the mechanism of preventing and dismantling unwieldy corporate size in excess of any plausible scale efficiency justification. The dynamism of antitrust policy in adjusting to intellectual movements and economic conditions could be

harnessed to re-establish the broad reach of antitrust and thus forge a reasonably useful public policy weapon to be directed at the too-big-to-fail problem.

It is worth noting at the outset that the thesis here is not that antitrust law, even if more vigorously interpreted and enforced, could have made much difference in averting any part of the recent global financial crisis. There is no real consensus about the causes of that crisis, but recent changes in the business of global banking and finance beyond the mere size of financial enterprises contributed to a systemic weakness rather than isolated weakness in one or a few participants. When Bear Stearns was rescued, presumably the intent was to prevent that domino from toppling into others and knocking down too many others. Since holding upright that domino did not prevent systemic failure, it seems probable that the causes underlay the system rather than merely residing in one or a few too-big-to-fail enterprises.

Nevertheless, there is an important public policy issue about whether to permit firms to combine where the result is an enterprise that exceeds efficient scale and at the same time owns a sort of sinecure against failure by being too-big-to-fail. If the out-sized firm cannot be allowed to fail, then allowing it to exist creates a risk to the economy and the treasury. If there is no offsetting benefit, the question then becomes whether there is an administratively practicable way for antitrust law to help contain the size of such enterprises.

This article presupposes that some enterprises in key sectors of our economy are too big to allow them to fail and whose scale exceeds optimal efficient levels. These are arguable assumptions that I leave to others to argue about. The purpose of this article is not to resolve those empirical questions but to explore whether antitrust should play a role in controlling the too-big-to-fail problem if these assumptions are accurate about firms that occupy indispensible roles in our national economy now or in the future.

a. The Paradox of Too-Big-To-Fail and Antitrust

It seems paradoxical that antitrust law appears to have had nothing to say about the problem of firms becoming too big to fail. The antitrust laws are uniquely addressed to the problem of maintaining healthy markets against distortion from excessive aggregations of economic power. Yet antitrust law has not intervened to prevent or redress the recent outbreak of systemic threats caused directly by companies that are too big and too integral to the functioning of markets to allow those firms to function normally without massive governmental infusions of capital. These companies in some instances have accumulated assets exceeding $1 trillion, and they cut across a broad swath of economic activity that includes investment banking, depositary banking, insurance, securities, mortgage lending, and automobile manufacturing. All of these industries are subject to antitrust law. Nearly all of the firms that have been considered too big to fail grew in large part by acquisition activity that is within the reach of antitrust laws and subject to pre-transaction clearance, and therefore with governmental consent

3 The Hart-Scott-Rodino Antitrust Improvements Act of 1974 requires pre-transaction notification to the federal antitrust authorities of most mergers and acquisitions where the
or acquiescence. Antitrust laws did nothing to intervene to prevent these firms from attaining potentially catastrophic dimensions. Yet the Sherman Act surely was not enacted so that firms could become so big, and so economically and politically powerful, that the mere possibility of their failure would impose unacceptable policy choices on the nation. Why, then, are so many firms too big to fail, and why has antitrust not done its part to prevent the possibility of these catastrophic failures?

This paradox unravels part way when one considers the ever-narrowing reach of modern antitrust law. As currently interpreted by the courts, U.S. antitrust law is a shadow of its original self. Whatever animated their enactment, antitrust laws no longer concern themselves with preventing bigness, and indeed tend instead to encourage large-scale enterprise for efficiency’s sake. Beginning with Continental T.V., Inc. v. GTE Sylvania, Inc., the antitrust laws in the United States began a steady process of judicial erosion to eliminate multiple and possibly conflicting policy objectives, distilling in their place the exclusive purpose of promoting consumer welfare through allocative and dynamic efficiency. With marginal and mostly theoretical exceptions, the efficient allocation of society’s scarce resources through the use of existing technologies and producing goods and services more efficiently using innovative new ones, comprise the sum total of the residual policy underpinnings of modern antitrust law. In light of these modern

5 It has been argued that “[t]o this day, the Supreme Court has not come close to saying that economic efficiency is the exclusive concern of the antitrust laws….“ H. Hovenkamp, Federal Antitrust Policy: The Law of Competition and its Practice, (3d ed. 2005), p. 69. However, no Sherman Act case since Klor’s, Inc. v. Broadway-Hale Stores, Inc., 359 U.S. 207 (1959) has even arguably turned on the policies of personal freedom to pursue economic opportunity, or the statutory policy of policing fairness in the marketplace, although those policies were frequently echoed in early antitrust cases. Aside from cases decided under the Robinson-Patman Act, 15 U.S.C. §13, no recent antitrust case turned on the policy of favoring small enterprise for its own sake, also frequently given voice on in an early generation of Sherman Act decisions. More to the point, however, there has been an outright abandonment of what once was central antitrust policy favoring fragmented markets populated by small businesses, even at some expense in the form of efficiency. Recent decisions make no mention of any general antipathy for big business nor preference for smaller enterprise, such as Judge Hand invoked in United States v. Aluminum Co. of America: “[A]mong the purposes of Congress in 1890 was a desire to put an end to great aggregations of capital because of the helplessness of the individual before them… Throughout the history of [the Sherman Act, the Surplus Property Act and the Small Business Mobilization Act] it has been constantly assumed that one of their purposes was to perpetuate and preserve, for its own sake and in spite of possible cost, an organization of industry in small unites which can effectively compete with each other.”148 F.2d 416, 429 (2d Cir. 1945). Since Brown Shoe v. United States, there has been no serious mention by the high court of any preference for small enterprise for its own sake. 370 U.S. 294, 344 (1962). (‘But we cannot fail to recognize Congress’ desire to promote competition through the protection
movements in antitrust law, it is perhaps not entirely surprising that antitrust has not prevented the too-big-to-fail problem, since consumer welfare narrowly conceived may be enhanced rather than harmed by permitting firms to become big and even indispensable.

However, the paradox is not altogether attributable to the narrowing focus of modern antitrust law. Although antitrust at one time considered the emergence of very large corporations to put the public at unacceptable risks, the risks that were of concern did not include the too-big-to-fail problem. Instead, antitrust in an earlier era was concerned about the bigness of enterprise as it threatened harm to others by the sheer power of outsized enterprise rather than its vulnerability to collapse. Thus there remains a perplexing aspect to this paradox: even the more robust antitrust regime that was overrun by the modern law and economics movement can be seen to have been unconcerned with preventing systemic failure by constraining firms from becoming too big to fail. What is curious about this is that the older antitrust regime was very much concerned with bigness for reasons that apply to the too-big-to-fail firm. Before the courts rewrote them, United States antitrust laws were understood as providing the public with protection against behemoth economic enterprises not only because of their tendency toward market dominance, but also for their power to paralyze or control democratic institutions through the exercise of their vast wealth. Justice Harlan described the Sherman Act nearly 100 years ago as arising from a universal conviction that “the country was in real danger from another kind of slavery… that would result from the aggregations of capital in the hands of a few…” As recently as 1979, near the onset of the Chicago School antitrust revolution, Robert Pitofsky wrote:

It is bad history, bad policy and bad law to exclude certain political values in interpreting the antitrust laws. By ‘political values,’ I mean, first, a fear that excessive concentration of economic power will breed antidemocratic political pressures, and, second, a desire to enhance individual and business freedom by reducing the range within which private discretion by a few in the economic sphere controls the welfare of all. A third and overriding political concern is that if the free-market sector of the economy is allowed to develop under antitrust rules that are blind to all but economic concerns, the likely result will be an economy so dominated by a few corporate giants that it will be impossible for the state not to play a more intrusive role in economic affairs.…

Of course, this final prediction could not have been more accurate. The ungainly size and perceived indispensability of “too-big-to-fail” enterprises has recently forced the

government to become the largest investor in the U.S. automobile industry\textsuperscript{8} as well as a controlling owner of some of the largest banks in the country, and to infuse hundreds of billions of dollars into financial services sector in the forms of equity investments, loans and loan guarantees. Federal funds also have been infused into the home mortgage refinance marketplace to forestall foreclosures.\textsuperscript{9} At least some of this government intervention was at least arguably a consequence of these sectors of economy being “dominated by a few corporate giants.” Moreover, government intrusion into the private sector in response to the too-big-to-fail issue appears to be nowhere near at an end. More government intervention of a more durable sort seems inevitable as the Congress considers enacting new laws to try to forestall in the future what existing regulatory law did not. Federal and state regulation has been enacted or is under consideration addressing dozens of areas of economic activity including real estate mortgage lending practices, trading in derivatives and other securities, solvency of financial institutions, management compensation, corporate governance, and even the permissible maximum size and investment activity of banks.

Antitrust from its origins has been concerned with preventing the accumulation and exercise of economic power, rather than the vulnerability of the public to the potential for widespread economic disruption from the inherent vulnerability of big enterprises. Antitrust has never been concerned with firms being too big to fail. The question therefore presents itself whether antitrust law \textit{might} turn its attention to the too-big-to-fail problem. As various alternative regulatory strategies are being considered to address the problem, antitrust law has emerged as having at least some potential to promote a healthier economy that is less reliant on the economic stability of a small number of very large firms. There is renewed interest in reinvigorating antitrust law to address the too-big-to-fail problem, also exploring whether existing antitrust rules without amendment might help. Indeed, the events that began in the second half of 2007 have led to a good deal of reflection about the extent to which antitrust has been weakened in recent decades and whether the focus of antitrust has become too narrow. Federal Trade Commissioner J. Thomas Rosch has advanced the view that a merger with the potential for catastrophic effects on a market as a whole can be challenged under the Clayton Act or the Federal Trade Commission Act for its tendency to destroy competition and harm consumers, and opined that amendments to antitrust laws would not be needed to bring them to bear in preventing undesirable growth of enterprises.\textsuperscript{10} That view, though admittedly controversial, is an important one because it suggests the possibility of expanding existing analytical approaches rather than necessarily amending the antitrust laws or turning exclusively to regulatory law instead. Assistant Attorney General for antitrust

(Hereinafter, “Rosch”) (“The Clayton Act is inherently prospective and the current standard prevents anticompetitive harm in its incipiency. Hence, if a merger creates a firm whose failure is likely to have a catastrophic effect on the market as a whole, because it is so integral to the market, the end result may be a substantial lessening of competition.”)
Christine Varney has also suggested that the relaxation of antitrust enforcement played a role in creating conditions that led to the economic collapse in 2008, which again suggests that enforcement of existing law could contribute to broader efforts to prevent catastrophic business collapses.¹¹

These official views may be correct, but antitrust might surely play a somewhat more important role if it were reinvigorated. Although there is no precedent for applying antitrust sanctions to block corporate indispensability for the reason that a company might fail catastrophically to the detriment of the nation’s economy as a whole, there is no reason in principle why antitrust could not respond to the emergence of such growth in the future. Of course, it may be that some too-big-to-fail companies got there without any possibility of antitrust intervention, at least not as antitrust is currently understood. Indeed, if one considers the recent failures of companies like AIG and Citigroup, which grew via conglomerate rather than horizontal accretion, even a clairvoyant prediction of the catastrophe that these companies precipitated would not have drawn antitrust intervention under the existing approach. However, other accumulations of corporate size, such as the mergers of financial institutions that were already too-big-to-fail, might be an appropriate target for antitrust. There is thus the potential at least worth considering that antitrust, consistently with its historic policy roots but with some reconstruction, could prevent some ultimately catastrophic combinations or even force break-ups of companies that become too big.

This article argues that modern antitrust law can contribute more than it has to reigning in the causes of long-run systemic instability represented by the “too big to fail” problem. The narrowed focus of Post-Chicago antitrust law is on allocative efficiency, which is rarely threatened directly by the sorts of risky conduct that give rise to systemic failures. However, antitrust law and policy have shown impressive adaptability and dynamism over the 120 years since the enactment of the Sherman Antitrust Act in 1890.¹² Indeed, although antitrust law in recent decades retreated from them, the broad array of policies that represented the foundations of antitrust for roughly a century have begun to rekindle interest among scholars and policymakers – and antitrust law reinvigorated by revival of the original broader policy underpinnings that predated the law and economics movement might have at least a less modest role to play. The article explores the potential application of such a revived antitrust law to the problem of the too-big-to-fail enterprise and argues that a combination of existing law, reinforced, along with new antitrust legislation could contribute significantly to the public policy arsenal of weapons for confronting this problem without doing violence to the fundamental objectives of

antitrust law. Part 2 defines the problem of “too-big-to fail” to identify some of the essential characteristics of the problem. Part 3 examines the limited reach of modern U.S. antitrust law and in particular how antitrust largely fails to address the essential characteristics of too-big-to-fail firms identified in Part 2. Part 4 then explores whether new or revived antitrust rules might provide some traction in addressing the policy problem presented by threats of catastrophic market failures. Part 5 concludes by advocating a modest proposal for reform.

2. **Defining the Problem – Some Elements of the “Too-Big-To-Fail” Problem**

   a. **The Public Policy Dilemma – Damned Either Way**

   Applying antitrust concepts to the too-big-to-fail problem would seek to prevent or soften a public policy dilemma that has recently forced difficult choices on the nation. The prospect of protecting a company against failure presents a deeply troublesome public policy dilemma. If a firm’s failure will cause a wave of failures in a large enough segment of the economy as a whole, one policy option is to provide public infusions of capital to stave off unacceptable outcomes that would follow the failure such as widespread economic disruption, possibly including recession or even a depression. The bail-out policy choice, however, carries with it another unacceptable outcome in addition to the taxpayer burden: moral hazard. Public rescue distorts future rational economic calculations of decision makers throughout the economy. Economic actors can be expected to take greater risks if they have reason to believe that they will be protected against adverse consequences. Furthermore, the bail-out prospect for only the largest firms creates a potentially undesirable incentive for firms to grow in order to attain that protection. If a firm can become “too big to fail,” it can more freely run risks with the expectation that the attendant risks will shift to the treasury rather than shareholders and managers. The risk-assessment incentive structure created by the likelihood of bailouts thus encourages firms to position themselves precariously and to take risks that would otherwise be irrational.\(^\text{13}\) A bailout thus may therefore solve one failure by inviting others later on

Another public policy dilemma created by a threatened systemic failure is presented when the government with finite resources must choose which among competing failures to cure via bailout funding. In the recent crisis, the federal government elected to preserve one investment bank, but not another. In March, 2008, Bear Stearns advised federal regulatory agencies that its liquidity position was so depleted that it would need to file for bankruptcy the next day absent an infusion of capital. Within days, the Federal Reserve and the Treasury Department moved to fund approximately $30 billion to JPMorgan Chase to allow the commercial bank to acquire the failing investment bank. Six months later, the Federal Reserve Bank of New York was confronted with the failure of another investment bank, Lehman Brothers. Although the Fed again considered a bridge solution via Bank of America and Barclays, and those banks declined, ultimately

the Federal Reserve participated in a decision about how far it would go to preserve both investment banks. Lehman Brothers is gone, Bear Stearns was saved. Making this sort of choice is not one that regulators ought to be making, as the regulators themselves concede:

Normally the market sorts out which companies survive and which fail, and that is as it should be… To prevent a disorderly failure of Bear Stearns and the unpredictable but likely severe consequences for the market functioning and broader economy, the Federal Reserve, in close consultation with the Treasury Department, agreed to provide funding to Bear Stearns through JPMorgan Chase.\textsuperscript{14}

The Fed’s different approaches to Bear Stearns and Lehman Brothers may very well be explained and even justified by the different contexts in which the two decisions were made. A decision in November 2008 to salvage Lehman Brothers would have been made by a Fed that was already buried in political fallout from its earlier rescue of Bear Stearns and in an economic environment that was going to require considerably more Fed largesse than was politically realistic: something had to give way and it turned out to be an investment bank. The demise of Lehman Brothers can be seen as having been forced by the many too-big-to-fail crises looming over the Fed as it made its decision.

The too-big-too-fail dilemma is therefore twofold. First the prospect of such a failure forces the government to choose between unacceptable immediate economic risks and long-term moral hazard. Second, it can involve the government in making decisions that are generally left to marketplace dynamics and outside the normal provinces of regulatory intervention, which runs contrary to the fundamental structure of a capitalist economic system.

\textit{b. Bigness}

Before turning to the antitrust law issues, it is worth pausing to examine the phenomenon of systemic failure and the characteristics of firms that create the threat. “Too big to fail” is shorthand and widely agreed to be a misnomer because “bigness” alone is not the problem. Very big firms in a number of industries have failed without provoking serious discussion of public bailout to avoid broader economic systemic failures. Enron, for example, failed in late 2001 at a time when it employed approximately 22,000 people and claimed to have revenues exceeding $100 billion. Based on reported revenues, Enron ranked 7\textsuperscript{th} on the Fortune 500 list in 2001. Its failure was not attended with any serious consideration of bailing it out, despite the enormous hardships that its demise visited upon tens of thousands of citizens. Enron was big, but not “too big to fail,” and indeed the Chairman of the Federal Energy Regulatory Commission reported to Congress a few months later that “Enron's collapse has not caused significant damage to the nation's

\textsuperscript{14} Statement of Ben S. Bernanke, Chairman, Board of Governors of the Federal Reserve System Before Senate Committee on Banking, Housing and Urban Affairs, April 3, 2008.
energy trading or energy supplies.” WorldCom was ranked the 42d largest company in America when it failed in 2001 with $39.2 billion in reported revenues and 85,000 employees. WorldCom was not simply big, it was far flung having acquired MCI in 1998 to become the second largest U.S. long-distance carrier, and also having acquired UNet, CompuServe, and America Online’s data network to become a leading internet infrastructure operator. Its market capitalization dropped precipitously by nearly $150 billion by early July 2002 as a consequence of revelations about accounting irregularities and due to the vast oversupply in the market for telecommunications capacity. On July 21, 2002, WorldCom filed what was at the time the largest bankruptcy in the nation’s history. No public policy debate emerged over whether to bail WorldCom out of its difficulties despite the extensive hardships and economic disruption its failure brought about.

c. Interrelatedness with the Economic Ecosystem: Unusual Dependencies

The firm that is “too big to fail” is really both big and in a big way integral to one or more industries of critical importance to the overall economy (or as one observer nicely put it, the “business ecosystem”). American Insurance Group, Inc. (“AIG”) is an instructive example of a company that was determined to “be too big to fail” based not only on its size but on other factors as well. It certainly was very big. AIG operated in four major business lines: (i) general property and casualty insurance, (ii) life insurance and retirement services, (iii) financial services, and (iv) asset management. As of September 30, 2008, AIG reported consolidated total assets in excess of $1 trillion and stockholders’ equity of approximately $71 billion. In 2007, AIG’s life and health insurance businesses ranked first in the United States measured by net premiums written ($51.3 billion) and third in terms of total assets at year-end ($364 billion). For the same period, AIG’s property and casualty insurance businesses ranked second in the United States measured by net premiums written ($35.2 billion) and third based upon total assets at year-end ($124.5 billion). It has been argued that the solution to the to-big-to-fail problem, at least in the financial services sector, should include limiting the size of firms like AIG so that any single firm’s failure would present less systemic risk.

18 See, e.g, Testimony submitted to the House Committee on Financial Services, Hearing on “Systemic Risk: Are Some Institutions Too Big To Fail And If So, What Should We Do About It?” Tuesday, July 21, 2009, 2pm. Submitted by Simon Johnson, Ronald Kurtz
However, AIG’s size alone does not account for the perceived need for its rescue, which instead stemmed from its vast commitments throughout the global financial markets. It was feared that a default on AIG’s commitments would have created a shock-wave effect across a broad swath of economic activity. Those who were at risk from a failure of AIG included large investors, small investors in money market mutual funds (including retirement accounts), insurance policyholders and claimants, state and local governments that had extended credit to AIG, global commercial banks, investment banks, and other financial institutions as well as subsidiaries of AIG itself. AIG was a major participant in derivatives markets as well as a significant counterparty to a large number of major national and international financial institutions. Out of credit swaps that had been sold by an AIG division having a notional value of $372 billion approximately $250 billion represented transactions that were designed to provide the financial institutions with regulatory capital relief. AIG’s failure would have impaired or even gutted the capital bases of many of the world’s largest financial institutions. Federal Reserve Board Chairman Benjamin Bernanke concluded, along with the Treasury Department, that:

At best, the consequences of AIG's failure would have been a significant intensification of an already severe financial crisis and a further worsening of global economic conditions. Conceivably, its failure could have resulted in a 1930s-style global financial and economic meltdown, with catastrophic implications for production, income, and jobs.

On September 16, 2008, the Federal Reserve and Treasury agreed to extend $85 billion in secured loans to AIG, and amount that subsequently increased to more than double that amount. The objective was not merely to protect AIG from the normal processes of bankruptcy, but to prevent a downward spiraling of the entire financial services sector in the United States and globally. AIG’s elaborate, unregulated and risky commitments cast a dark shadow across a network of counterparties whose contractual interrelationships had created mutual dependencies on a vast scale.

Interrelatedness is thus a characteristic of the too-big-to-fail firm, whose mutual interdependencies are substantial in scope and unsusceptible of satisfactory resolution through bankruptcy. The extent of these interdependencies seems important in distinguishing between firms that are too big to fail and firms whose failures result in harsh but acceptable consequences. Many large companies maintain interdependent relationships with many others, but only some of these reach levels that can draw entire economic systems into potential collapse. Enron, for example, was intricately interconnected and certainly was not in its own solitary orbit when it failed. It was deeply interrelated in energy markets, and its failure caused serious problems in entirely unrelated markets as well as in natural gas where the prospect of Enron’s contracts going unhonored sent shock waves through that particular market. More immediately its

Professor of Entrepreneurship, MIT Sloan School of Management; Senior Fellow, Peterson Institute for International Economics; (“[S]ome will complain about ‘efficiency costs’ from breaking up banks, and they may have a point. But you need to weigh any such costs against the benefits of no longer having banks that are too big to fail. Anything that is ‘too big to fail’ is now ‘too big to exist.’”) (Emphasis added).
demise cost over 28,000 employees at Arthur Andersen’s U.S. operations their jobs and 1,750 Andersen partners lost most of their entire life savings.\(^{19}\) However, the extent of economic harm from Enron’s demise was contained without government bailouts, and no threat was perceived across the economy as a whole. So a firm that is too-big-to-fail is one whose interdependencies extend so far that failure of the firm spells broader failures that could harm the economy as a whole. Enron’s failure might have brought about failures of a large number of natural gas traders, for example, but the emanations for those failures would not have been anything comparable to the global bank failures that would apparently have resulted from a failure to rescue AIG.

c. Surrounding Economic Context

Context also matters, because a company can either be too big to fail or not depending on the economic conditions surrounding the potential failure. By the time AIG stood ready to fail, the financial system and in particular the credit markets were already deeply troubled. AIG’s counterparties included a significant part of the world’s markets for credit, and they in turn were very much at risk of collapse if AIG’s commitments to them turned out to be worthless. Furthermore, AIG was not alone in its perilous condition, and many of its largest counterparties were weak or had already failed. When the United States loaned AIG $85 billion on September 16, 2008, credit markets were already in turmoil from the government’s takeover of Fannie Mae and Freddie Mac ten days earlier, and from the Lehman Brothers’ bankruptcy filing on September 15, 2008. Other major financial institutions were under stress, including among others Bear Stearns and Merrill Lynch. The risks of allowing AIG to file for bankruptcy in this context were perceived as too great. As Chairman Bernanke testified before Congress, the decision to invest in AIG was driven not just by AIG’s role in the broader economic ecosystem, but by the economic context in which the failure of AIG would have occurred absent government intervention:

> It was an extraordinary time. Global financial markets were experiencing unprecedented strains and a worldwide loss of confidence. Fannie Mae and Freddie Mac had been placed into conservatorship only two weeks earlier, and Lehman Brothers had filed for bankruptcy the day before. We were very concerned about a number of other major firms that were under intense stress.\(^{20}\)

It follows from this testimony that the public policy makers who decided that the government needed to invest in AIG probably would not have taken that step in some other economic climates. Had credit markets not already been strained, had Fannie Mae, Freddie Mac, Lehman Brothers, Bear Sterns, Merrill Lynch, Citigroup, Wachovia and many other financial behemoths not been imperiled at the same moment, there is reason to doubt whether AIG failing all by itself would have threatened the economy as a whole as it did. Thus a company is not simply “too big to fail” in the abstract, but poses broader risks in some contexts than others – some of these presenting unacceptable risks.

3. **Post-Chicago Antitrust Law and the “Too Big To Fail” Problem**

The foregoing is not intended as an empirical study of the problem, which would certainly be a worthy but a different undertaking. The purpose of identifying certain of the characteristics of firms whose failures are regarded as presenting unacceptable consequences is to focus the consideration on the problems that antitrust would need to address in order to be of any help in mitigating or avoiding the public policy dilemmas posed by these impending business failures, and it is with this in mind that the partial list above was fashioned. Again, these characteristics include: (1) size; (2) interrelatedness in the economic ecosystem; and (3) surrounding economic context or events. Having identified some of the common elements of the too-big-to-fail problem, it begins to emerge why United States antitrust law as it is currently understood and enforced might have at most very limited application to help avert or solve future too-big-to-fail problems.

### a. The Narrow Modern Focus of U.S. Antitrust Policy

The current state of antitrust law is often referred to as embracing “post-Chicago School” economic theory. Post-Chicago antitrust is the stepchild of Chicago School antitrust, which represented a radical departure from historic antitrust policy. As discussed later in this article, antitrust policy (and thus antitrust law itself) has had a dynamic history, changing rather dramatically in response to intellectual developments in the field of economics and also to changes in the economy itself. Early antitrust law decisions embraced a sweeping array of economic, political and social policies. A turn toward a less value-laden antitrust law began to take shape in the 1970s, promoted by intellectual descendants of Oliver Wendell Holmes. Lawyers for corporate interests and industrial

21 Nor is it exhaustive. For example, another characteristic of a firm that presents a “too big to fail” problem might be the absence of certain types of culpability. Public bailouts are not as likely to be considered in response to a failure brought about by criminal misconduct on the part of corporate management. “Too-big-to-fail” problems often result from risky conduct, and indeed the problem is essentially one of loss-shifting to the treasury and away from the corporate actors who took the risks. However, when the risks that precipitate corporate collapse are substantially aggravated by illegal or fraudulent conduct, relief sought from the government meets with an additional layer of political resistance. Enron and WorldCom failed as a direct consequence of conduct that was highly risky and which was unlawfully and deliberately concealed in violation of civil and criminal securities laws, among others. Fraud concealing their financial downturn allowed the risky conduct to persist until its cumulative effects brought about irreversible failures. No serious consideration was given to public bailouts. However, if criminality brings on a business collapse with devastating collateral damage to the economy or investors, the resulting problem is more directly addressed otherwise than by antitrust law.

organization economists of the Chicago School mounted an organized effort that succeeded in persuading the federal courts to adopt a far narrower view of antitrust as having as its single objective the avoidance of economically inefficient transactions, referred to by economists as allocative efficiency.\textsuperscript{24} In the last two decades of the Twentieth Century, antitrust law embraced this narrow, Chicago School, doctrinal approach to antitrust law and with it accepted as the dominant antitrust policy the optimization of allocative efficiency of firms and markets.\textsuperscript{25} This objective was advocated in some influential quarters as the \textit{exclusive} policy of the Sherman Act. For example a leading proponent of the Chicago School argued that the “whole task of antitrust can be summed up as the effort to improve allocative efficiency without impairing productive efficiency so greatly as to produce either no gain or a net loss to consumer welfare.”\textsuperscript{26} In the earliest phase of this revision and reconstruction of antitrust law, Chicago School adherents persuaded the courts not only to restrict antitrust to enforcement of efficient markets, but more radically that markets whose allocative

\textsuperscript{25} Allocative or economic efficiency of markets refers to the situation in which it is impossible to generate a larger total societal welfare from the available resources without technological advancement. Allocative efficiency differs from distributive values or fairness. Chicago School proponents argue that economics should concern itself only with aggregate welfare rather than distributive welfare – i.e., how much society produces at what cost, but not who gets it. The founder of the Chicago School articulated its value-barren approach: “Why do economists object to monopoly? The purely ‘economic’ argument against monopoly is very different from what noneconomists might expect. Successful monopolists charge prices above what they would be with competition so that customers pay more and the monopolists (and perhaps their employees) gain. It may seem strange, but economists see no reason to criticize monopolies simply because they transfer wealth from customers to monopoly producers. That is because economists have no way of knowing who is the more worthy of the two parties—the producer or the customer. Of course, people (including economists) may object to the wealth transfer on other grounds, including moral ones. But the transfer itself does not present an ‘economic’ problem. Rather, the purely ‘economic’ case against monopoly is that it reduces aggregate economic welfare (as opposed to simply making some people worse off and others better off by an equal amount). When the monopolist raises prices above the competitive level in order to reap his monopoly profits, customers buy less of the product, less is produced, and society as a whole is worse off. In short, monopoly reduces society’s income.” Stigler, George J, 1982. “The Economists and the Problem of Monopoly,” American Economic Review, American Economic Association, vol. 72(2), pages 1-11. By defining economics as “value neutral,” and then pressing for purely economics-driven antitrust law interpretations, the Chicago School sought to strip antitrust of any role as referee over the fairness of markets or the distributive fairness of the economy as a whole.

efficiency is distorted by monopolistic or conspiratorial misconduct tend to self-correct without great cost to society and thus take greater benefit from judicial restraint than from costly and error-prone judicial intervention. The Chicago School came to dominate judicial and federal agency interpretations of the law, and played a central role in a string of Supreme Court decisions overturning more liberal, time-worn, precedents. The elevation of allocative efficiency as the central goal of antitrust became widely accepted, so much so that courts and commentators often seem to believe that this had always been antitrust’s exclusive concern. Allocative efficiency is equated with consumer welfare in the sense that consumers are best off in a market that achieves optimum allocative efficiency – prices in such markets send accurate signals to producers and innovators to yield optimum outcomes for consumers. While the most extreme position, that no other policies aside from consumer welfare have any relevance, was not been adopted by the courts, and certainly not by the Supreme Court, economic efficiency came to predominate to a large an extent and effectively displaced other policy objectives that at one time or another were considered important considerations in the application of antitrust law. During this Chicago School phase, antitrust enforcement at the federal level was largely confined to unambiguous cartel activity and blatantly problematic mergers, leaving more

29 As a senior economist at the United States Department of Justice Antitrust Division put it succinctly: “efficiency is the goal, competition is the process.” Kenneth Heyer, Address before the Merger Task Force of the European Commission's Directorate General for Competition, (Apr. 9, 2002). See also Lawrence Summers, Competition Policy in the New Economy, 69 Antitrust L.J. 353, 358 (2001), ("...it needs to be remembered that the goal is efficiency, not competition. The ultimate goal is that there be efficiency”). The efficiency-oriented policy of competition law has also gained favor in international circles largely at the instance of United States policy makers and scholars. For example, a 1996 report of the Organization for Economic Cooperation and Development affirmed that “the basic objective of competition policy is to protect competition as the most appropriate means of ensuring the efficient allocation of resources -- and thus efficient market outcomes -- in free market economies.” Organization for Economic Co-operation and Development. subtle misconduct to marketplace self-corrections that the Chicago School doctrine anticipated would always or nearly always solve problems better than antitrust courts.\(^{30}\)

Critics of the Chicago School found a number of flaws in the theory, and also cautioned against elevating theory over facts in deciding antitrust issues. Markets do not tend neatly to follow theory, and market imperfections can confound the application of theory to the complex factual settings that typically are encountered in antitrust matters.\(^{31}\) A new, more moderate “Post-Chicago School” approach thus emerged in the early 1990s,\(^{32}\) and eventually succeeded in establishing a somewhat more tempered approach. Post-Chicago antitrust continues adherence to the limited objective of economic efficiency but relies with less assurance on market forces to correct interferences with market competition.\(^{33}\) Although somewhat tempered as measured against the early Chicago School, “Post-Chicago” antitrust departs from the Chicago School views mostly around the margins. Market concentration is not regarded as an ill, let alone an evil, in the absence of entry barriers;\(^{34}\) abuse of monopoly power is scrupulously distinguished from vigorous successful competition by dominant firms;\(^{35}\) vertical price and non-price restraints are broadly tolerated;\(^{36}\) predatory pricing is regarded as an unlikely source of consumer harm;\(^{37}\) and antitrust has retained as its primary targets the more virulent forms

Brown & Williamson Tobacco Corp.**, 509 U.S. 209, 226 (1993)(“As we have said in the Sherman Act context, predatory pricing schemes are rarely tried, and even more rarely successful, and the costs of an erroneous finding of liability are high. The mechanism by which a firm engages in predatory pricing -- lowering prices -- is the same mechanism by which a firm stimulates competition; because cutting prices in order
of cartel activity and certain obviously problematic merger activity. And, although “post-
Chicago” confidence in the self-correcting tendencies of markets has dampened, it
remains a persistent theme. Recently, Joseph Schumpeter’s 1942 treatise Capitalism,
Socialism and Democracy, which predicted the self-destruction of capitalism, has
enjoyed a surprising and influential revival at least as to its metaphorical description of
the “gales of creative destruction.”\(^3\) According to Schumpeter and his modern
adherents, market participants are understood to be in many cases competing for the
market rather than within it, and competition on the basis of price is a poor heuristic to
explain how markets actually function. Citing Schumpeter for a position that is broadly
tolerant of monopoly power as a lure toward innovation, the (now former) Assistant
Attorney General for antitrust remarked in 2006: “The existence of firms with large
market shares does not necessarily or even typically reflect competitive harm—to the
contrary, firms typically obtain large market shares by offering products that consumers
prefer over other firms’ offerings.”\(^4\)

Thus Post-Chicago antitrust remained skeptical of antitrust intervention, but marginally
less so than its more radical precedent in the Chicago school. However, current antitrust
law has been blunted by concerns about so-called “type I error” or over-enforcement of
antitrust rules.

b. Inherent Limitations of Post-Chicago Antitrust As a Public
Policy Tool To Address Too-Big-To-Fail Problems

A preliminary consideration is thus whether current Post-Chicago economics and
antitrust policy could conceivably be applied to prevent or unwind the existence of a too-
big-to-fail firm, or to prevent its actual or impending failure. On its face, this seems a
doubtful proposition. The central purpose of modern antitrust law is the protection of
consumer welfare, meaning price, output and innovation.\(^5\) It has been suggested\(^6\) that
the actual or even potential collapse of a too-big-to-fail firm implicates consumer
welfare, and does so in a manner that existing antitrust law principles might address by
application of Section 7 of the Clayton Act\(^7\) to the mergers and other business
combinations that create these behemoths, or perhaps by application of Sections 1 or 2 of

the Sherman Act. For example, Commissioner J. Thomas Rosch of the Federal Trade Commission has speculated that “mergers should arguably be examined with an eye toward whether they are creating a merged entity that is ‘too big to fail.’ If so, the transaction may violate Section 7 (or Section 1).” Commissioner Rosch’s point was not the trivial one that some mergers that create very big combinations may violate the standards set forth in existing law or policy statements by exceeding tolerable concentration levels. Instead, Commissioner Rosch articulated the view that it is at least possible, without amending the law, to interpret it to protect against some instances of the sorts of business collapse that result in traditional forms of consumer harm, such as reduced output when an entire industry is hobbled. Furthermore, since antitrust laws addressing mergers are prophylactic, the argument extends not only to cleaning up a too-big-to-fail problem, which comes too late to protect consumers, but more ambitiously to prevent the problem before it bubbles up. Supra-competitive prices and diminished innovation can result from several variations of antitrust violations: monopolization of the relevant market, mergers and acquisitions that create or enhance market power, and conspiracies or other concerted actions that exert collective market power to fix prices, reduce output or inhibit innovation. Since the failure of a too-big-to-fail firm would unavoidably reduce economic activity, and thus output, for a protracted period of time and might also eliminate or restrict investments in R&D (so goes the argument), antitrust policy should address itself to this general area of public concern. That is, if the failure of a too-big-to-fail firm could bring about the sorts of consumer harm that the antitrust laws protect against, then antitrust law might be implicated by the emergence of such firms in the first place, before they fail.

The argument is appealing but its limitations are apparent. First, not all consumer harm in the form of higher prices, reduced output or diminished innovation implicates antitrust policy because sometimes these harms are brought about by mechanisms that antitrust is not concerned with. Consumers have certainly suffered a variety of hardships from the financial meltdown, including evictions from their homes, loss of jobs, disappearing retirement savings, higher prices for certain types of credit, and generally diminished output throughout the economy. These harms were to a large degree precipitated by the mismanagement of too-big-to-fail banks and other financial institutions. But are these antitrust harms? Not obviously, anyway, and antitrust law has been cabined in deliberately to avoid extending antitrust remedies to every sort of conduct that may harm consumers – they must be harmed in particular ways that are quite limited. For example, consumers also suffered economic harms when the attacks on September 11, 2001 led to (among other more horrible consequences) the immediate grounding of all air traffic within the United States, thus reducing output in the air transportation markets – but no one could argue that Khalid Sheikh Mohammed violated the antitrust laws by restraining trade in those markets. The mechanism by which output was affected by terrorist attacks

was different from the sort of activity that antitrust is intended to prevent. Antitrust law seeks to prevent antitrust injury, and the “antitrust injury” element of an antitrust case has been construed narrowly to mean injury flowing from conduct that violates antitrust rules of conduct, which prohibit, for example, price fixing. (The standard might have been reversed, so that antitrust claims could always be brought to remedy harm to the marketplace, thus defining antitrust rules broadly to embrace any sort of conduct that had the requisite consumer welfare effects.) The courts have on this basis limited antitrust remedies to redress only certain types of reasonably well-understood categories of marketplace misconduct, so that flying an airplane into the World Trade Center does not count regardless of its intended and actual consequences for the economy. So, one challenge with addressing antitrust law to the too-big-to-fail problem is to connect the requisite sorts of consumer harm with the sorts of anticompetitive mechanisms that antitrust law cares about. Being big or about to fail are not obviously among these since antitrust is not a status offense. Beyond that, even being very big and taking what turn out to be poorly considered risks are not obviously antitrust offenses either because that is not the sort of conduct antitrust seeks to prevent – at least not under post-Chicago antitrust. Thus, as a starting point, antitrust intervention to prevent too-big-to-fail problems could not prevent the collapse of a firm would not cause any sort of antitrust injury to consumers or which caused such harm via the wrong mechanisms.

An additional limitation of Post-Chicago antitrust is its preoccupation with so-called Type One errors, or over-deterrence. The case that redefined and all but eliminated the offense of predatory pricing found as its central motivation the avoidance of punishing price cutting behavior that might be predatory coupled with any perceivable risk of at the same time discouraging price cutting that is competitive. “As a general rule, the exclusionary effect of prices above a relevant measure of cost either reflects the lower cost structure of the alleged predator, and so represents competition on the merits, or is beyond the practical ability of a judicial tribunal to control without courting intolerable risks of chilling legitimate price cutting.” The case that extended the Brooke rule to predatory bidding evoked an amicus brief from the Antitrust Division that, along with several of its other amicus briefs evidenced the same preoccupation with the “false positive” problem and over-deterrence. The Supreme Court in that case agreed with the Justice Department, again reciting “intolerable risks of chilling legitimate procompetitive

45 Brunswick Corp. v. Pueblo Bowl-O-Mat, Inc., 429 U.S. 477, 489 (1977)(“Plaintiffs must prove antitrust injury, which is to say injury of the type the antitrust laws were intended to prevent and that flows from that which makes defendants’ acts unlawful. The injury should reflect the anticompetitive effect either of the violation or of anticompetitive acts made possible by the violation.)

48 “[A] broader rule could lead to ‘false positives’ and thereby ‘chill the very conduct the antitrust laws are designed to protect…”” Brief for the United States as Amicus Curiae in Weyerhaueser Company v. Ross-Simmons Hardwood Lumber Company No. 85-381 (May 2006).
conduct.” 49  Most recently the Court introduced a new rule to bar most “price squeeze” claims, again citing this same “intolerable risk” of false positives, and again supported by the Antitrust Division’s refrain “the risk of imposing liability in cases involving procompetitive price-cutting, and ‘the costs of [such] an erroneous finding of liability are high,’ … because such errors (or ‘false positives’) would ‘chill the very conduct the antitrust laws are designed to protect.’” 50  In another decision that recites this same policy basis the Court all but eviscerated the essential facilities doctrine along with the Second Circuit’s “monopoly leveraging” rule. “Mistaken inferences and the resulting false condemnations ‘are especially costly, because they chill the very conduct the antitrust laws are designed to protect.’” 51  Here to the Antitrust Division along with the Federal Trade Commission encouraged the result urging that the doctrine “encourages litigants to seek antitrust remedies for ordinary commercial and regulatory disputes” – in other words, chills competitive conduct. 52  From this policy perspective a number of antitrust rules have been relaxed or even eliminated.

When one considers the conduct that post-Chicago antitrust prohibits against the backdrop of the characteristics of a too-big-to-fail firm, it becomes apparent that there is just a very limited application of current antitrust principles to the problem. This is not to say there is no room for productive antitrust intervention, but realistically there is very little.

c. Specific Problems with the Application of Existing Antitrust Rules to the Too-Big-to-Fail Firm

Among the attributes of a too-big-to-fail company identified above, the attribute that seems the most obvious subject for antitrust policy is bigness. There are three main impediments in the way of applying modern antitrust law to preventing bigness of the too-big-to-fail sort. First, allocative efficiency tends to favor or at most be neutral to bigness. Since the vast scale of the too-big-to-fail enterprise is an essential ingredient of the problem, antitrust’s modern ambivalence or outright resistance to controlling bigness poses one problem. A second problem is that of the self-inflicted wound: antitrust opposes monopolistic misconduct, mergers or collusion but it does not oppose the self-destruction of a dominant firm even where the result is the same sort of consumer harm or allocative inefficiency. Third, prophylactic antitrust rules are timid about speculating and the too-big-to-fail problem is layered in just the sort of contingencies that antitrust precedents resist making predictions about. If antitrust is to have a meaningful role in

containing the problem of catastrophic business failures, it will need to overcome these three problems.

(i) **The Bigness Problem**

The approach that antitrust law currently takes toward bigness creates the first of these limitations. With the possible exception of merger enforcement, antitrust as currently understood has no particular antipathy toward large-scale enterprise and in fact tends on balance to encourage it. The most immediate competitive effects of the sheer size that are recognized by antitrust law are potential scale economies, which can benefit consumers through the increased efficiency they represent. In many contexts antitrust law has found scale economies worth encouraging, and conversely modern antitrust law is cautious about condemning the large size of enterprises where economies of scale may be involved. This holds true across virtually the entire swath of antitrust law, including rules addressed to collusion, mergers, joint ventures and the conduct of dominant firms. Thus, for example, economies of scale may (like other efficiencies) constitute a defense to a merger challenge.\(^{53}\) In evaluating a hospital merger under the Clayton Act,\(^ {54}\) an appellate court noted that the “evidence shows that a hospital that is larger and more efficient… will provide better medical care than either of [the merging] hospitals could separately. The merged entity will be able to attract more highly qualified physicians and specialists and to offer integrated delivery and some tertiary care… The evidence shows that the merged entity may well enhance competition….”\(^ {55}\) Of course, under modern antitrust principles it was of no consequence in that case that the merged firm’s ability to attract the best doctors might adversely affect other hospitals, or that its size might make the firm indispensible to the community so that its failure could never be tolerated. In the context of a single firm with monopoly power, antitrust law does not inhibit its taking advantage of economies of scale even where smaller rivals are disadvantaged as a result.\(^ {56}\) Mergers are not the only setting in which antitrust champions scale efficiencies. At the retail level, economies of scale have been regarded as a legitimate reason for a

\(^{54}\) Section 7 of the Clayton Act prohibits certain mergers and acquisitions whose effects may be to substantially lessen competition in any line of commerce. 15 U.S.C. § 18.

U.S. Tobacco Co., 290 F.3d 768, 783 (6th Cir. 2002) (“In determining whether conduct may be characterized as exclusionary, it is relevant to consider its impact on consumers and whether it has impaired competition in an unnecessarily restrictive way. If a firm has been attempting to exclude rivals on some basis other than efficiency, it is fair to characterize its behavior as predatory [or exclusionary.] However, merely because an entity has monopoly power, does not bar it from taking advantage of its scale of economies because of its size. Such advantages are a consequence of size and not the exercise of monopoly power.”)(Citations and quotation marks omitted).
manufacturer to limit intrabrand competition by imposing vertical restraints.\textsuperscript{57} Combinations of competitors into joint ventures to achieve economies of scale are also generally tolerated, and the presence of efficiencies such as scale economies can remove a challenge from the application of per se condemnation by establishing a facially plausible justification for the concerted activity.\textsuperscript{58} Removing conduct from per se illegality comes close to legalizing it given the rarity of plaintiff successes in challenging conduct under the rule of reason.\textsuperscript{59} Thus modern antitrust law tends to encourage, rather than to discourage, bigness. This is an unsurprising consequence of the focus on allocative efficiency. A firm achieving scale economies produces greater output at lower cost. That other competitors might be devastated in the process is not a modern antitrust concern. Nor is it of any concern that the scale efficiency comes with indispensability to the marketplace.

Only in the most indirect way does modern antitrust discourage bigness by imposing somewhat more stringent standards on firms that have market power (which sometimes equates to bigness, although not always) or that operate in oligopoly markets (in which the small number of rivals sometimes means that they are large, but not always). The existence of monopoly power is not unlawful by itself, but Section 2 of the Sherman Act imposes different, more stringent, standards of conduct on firms that have (or threaten to achieve) market power.\textsuperscript{60} Monopolies tend to be large, and since antitrust law imposes a different set of rules on their conduct, to this limited extent even post-Chicago antitrust may be said to disfavor large size enterprise, albeit in a very indirect and limited manner. To a similarly limited extent, Section 1 of the Sherman Act sometimes imposes more stringent standards on firms in highly concentrated markets, or at least exposes them to antitrust risks that probably inhibit a certain amount of marketplace conduct that would otherwise occur.\textsuperscript{61} Firms operating in a market with oligopoly structure are subject to

\textsuperscript{57} “A purpose to facilitate point-of-sale services or to protect minimum economies of scale could induce a manufacturer to limit intrabrand competition. \textsuperscript{59} One rare successful challenge under the rule of reason is found in Polygram Holding, Inc. v. FTC, 416 F.3d 29 (D.C. Cir. 2005), a case that is indicative of the difficulties plaintiffs face under Post-Chicago School antitrust rules. In that case the FTC challenged an agreement between competing record companies to suspend advertising and discounting of two record albums temporarily during the launch period for a jointly-produced recording. The court affirmed the FTC’s application of the rule of reason to the challenged agreement, even though it involved competitors agreeing not to put specific products on sale for a period of time – a collusive restriction on price and advertising that in an earlier era probably would have met with per se condemnation.

\textsuperscript{60} 15 U.S.C. § 2.

certain limitations on their behavior, and may be found to have engaged in unlawful price fixing or tacit collusion in circumstances in which participants in more diffuse markets would not. For instance, “a showing of parallel business behavior is admissible circumstantial evidence from which the fact finder may infer agreement” in a Sherman Act conspiracy case.\(^62\) While such parallel conduct alone is not enough to support a conspiracy complaint,\(^63\) the potential exposure to antitrust remedies clearly can discourage firms in an oligopoly market from acting as freely as they might in a more competitive one, particularly if they are interacting through trade associations or in other contexts so that the parallelism combines with other possible evidence of collusion. Thus, antitrust law imposes certain burdens on monopolists and oligopolists, and to this limited extent can be seen as disfavoring these market structures.

However, it is one thing to demand higher standards of conduct in monopolistic and concentrated markets, and quite another to discourage the existence of big firms. First, size and market power are not the same thing so that many big firms do not have market power that would even implicate the constraints of heightened antitrust scrutiny. These constraints apply to some big firms, but not all, and also can apply to small firms. Indeed, monopolies can be large but they can also be small by any measure, such as a monopoly held by virtue of a patent over a small but essential input, or in a market that can sustain only a single small seller such as the local baker in a village without any others.\(^64\)

More importantly, the potential for encountering more stringent antitrust conduct rules would not plausibly lead firms to control their own size. The economic inducements for growth and market power are compelling and vast size can in some cases be obtained without even implicating antitrust rules by conglomerate or out-of-market acquisition activity. It seems unlikely that a firm would decide, for example, to forego an opportunity to increase its size and market share on the thin ground that doing so would require it to be more cautious about attending trade association meetings. Furthermore, growth in key sectors of the economy has been fueled by market extension combinations that do not even implicate antitrust rules. The banking industry, one that is central to the too-big-to-fail crisis, is an excellent example. In fact, the banking industry has been transformed from relatively small and local enterprises to global giants as a consequence of merger activity and relaxed regulation. Between 1980 and 1999 the number of commercial banks declined from approximately 15,000 to just 9,000. The trend toward concentration continued into the new century. At the end of 2000, there were 397 banks with assets of $1 billion or more; by mid-2009 there were 136 more of these large banks, and at the same time the total number of commercial banks dropped by approximately 1320 banks.\(^65\) The concentration of the banking industry provoked almost no antitrust intervention. Only when bank mergers combine competing banks with overlapping

\(^{63}\) Id.

geographic reach are the antitrust laws even implicated. The biggest bank mergers have often involved little in the way of competitive overlap and have thus been waived through by antitrust and banking regulators without conditions or with minimal divestitures imposed as conditions for these approvals. Thus antitrust is not deterring the existence of big firms by treating those with market power somewhat differently than those without it.

What is missing from antitrust is any real discipline against the vast attenuated size and shape of the too-big-to-fail company. There is no prohibition against size, and to the contrary modern antitrust law probably on balance coddles corporate expansion more than it impedes it.

(ii) The Self-Inflicted Wound Problem

The second difficulty with resorting to antitrust law to prevent colossal failures is that antitrust conduct standards do not restrict risk taking activity, even if the risks are obviously ill-advised. The wound that is inflicted in a violation of antitrust law is inflicted on consumers and perhaps on rivals, but not on the actor. All aspects of antitrust law prohibitions concur in this respect. Thus, monopoly law prohibits certain forms or predatory and exclusionary conduct by dominant firms that harms market competition by weakening or destroying their rivals or preventing their emergence into the marketplace. Merger prohibitions seek to prevent the acquisition of monopoly power for the same ultimate purpose. Conspiracy antitrust prohibitions target the combined exercise of market power to harm competition. No antitrust prohibition directs itself against self-inflicted harm. Indeed, the core article of faith behind antitrust law is the belief that firms in a competitive struggle will conduct themselves to benefit, and thus attract,

---

66 For example, the proposed merger of PNC Financial Services Group, Inc. with National City Corporation was approved by the Antitrust Division of the United States Department of Justice on the condition that the parties divest a total of 61 branches in western Pennsylvania with approximately $4.1 billion in deposits, as well as certain middle-market lending operations of National City Bank in the region. Thus in the area of their most significant competitive overlap the merger implicated antitrust rules pertaining to mergers and triggered the imposition of the divestiture remedy. However, even with this structural remedy the merger created the nation’s fifth largest bank with $289 billion in assets and about $180 billion in total deposits. The $4.1 billion divestiture represented only a little more than 2% of the merging parties aggregate deposits. See, “Justice Department Requires Divestitures in Acquisition of National City Corporation by PNC Financial Services Group,” press release dated December 11, 2008 available at http://www.justice.gov/atr/public/press_releases/2008/240315.pdf.

67 Some antitrust violations involve agreements that restrict the freedom of firms to expand their market share by competing, and in some sense thus involve what might be regarded as self-inflicted harm. However, a market allocation or similar such restraint is intended on balance to be profitable for the conspirators, and so impose no net harm on them. The too-big-to-fail firm is one that is approaching collapse, and antitrust rules do not prohibit companies from collapsing.
consumers. Antitrust economics proceeds on the assumption that the objective of all firms is to maximize profits. In order to maximize profits, firms must decide how much to produce and sell, and how to produce and sell it — that is, they must decide how to compete. If a firm perceives that a risk is worth taking in that endeavor, antitrust courts will not second-guess it to block the taking of that risk \textit{ex ante} or to punish it \textit{ex post}. Antitrust fosters competition only by keeping it open, not by preventing it or directing companies how to succeed or at least avoid failure.

By contrast, the too-big-to-fail firm is a threat to the economy by virtue of wounds that are self-inflicted rather than inflicted by it upon others for its own advancement. The essential feature of a firm that has become too big to fail is that it has somehow threatened its own economic survival, generally by taking ill-advised risks or pursuing a disastrous business strategy. A firm that fails is, by definition, inefficient in the sense that the resources dedicated to the firm are producing poor results. Even if the failure of such a firm would harm consumers by eliminating that firm’s rivalry, no part of the objectives of antitrust would be served by locking inefficient participants in a market — quite the contrary. If a firm exits a market and leaves its last standing rival with a monopoly it is not the case (nor should it be) that the exiting firm violated the antitrust laws by closing up shop. True, its conduct created a monopoly, but in another firm rather than for itself. Absent a collusive deal in which the firm is paid to exit the market, the mere act of departure is not illegal. To hold otherwise antitrust law would impose a sort of Iron Curtain around markets, forbidding departures on pain of civil or even criminal prosecution.

Thus antitrust law is directed a conduct that harms other firms rather than self-inflicted wounds that characterize the too-big-to-fail firm. The moral hazard problem is that the firm that is too big to fail can take risks that fall on someone other than the actor. That is believed to lead to excessive and inefficient risk taking, but antitrust law is simply not directed at preventing even mindless leaps toward profits, even if the results of such conduct may very well inflict catastrophic consumer harm.

\textit{(iii) The Incipiency Problems}

A final problem with the application of existing antitrust rules to the too-big-to-fail problem is the incipiency issue. Mostly, antitrust law applies \textit{post hoc} to condemn past conduct that has already interfered impermissibly with competitive markets. Furthermore, standing and antitrust injury remedial standards for private litigation require proof that both the marketplace and the plaintiff have been harmed.\textsuperscript{68} Thus, most antitrust prohibitions do not reach incipient problems at all and those few that do only apply to likely or probable violations. Thus, for example, the standard for assessing most claims under Section 1 of the Sherman Act is the Rule of Reason, which evaluates whether concerted action has had a net anticompetitive effect taking into account the history and nature of the restraint.\textsuperscript{69} Conduct falling within the \textit{per se} rules under Section

1 are presumed to have such effects. Either way, alleged offenses under Section 1 are scrutinized for past actual effects rather than projected future ones.

There are, of course, antitrust statutes applicable to prevent incipient harm. Section 7 of the Clayton Act prohibits any transaction “where in any line of commerce or in any activity affecting commerce in any section of the country, the effect of such acquisition may be substantially to lessen competition, or to tend to create a monopoly.” Section 7 seeks to forestall anticompetitive mergers “in their incipiency” before their effects occur, and thus requires a prediction about the merger’s impact on future competition. “Section 7 does not require proof that a merger or other acquisition has caused higher prices in the affected market. All that is necessary is that the merger create an appreciable danger of such consequences in the future. A predictive judgment, necessarily probabilistic and judgmental rather than demonstrable is called for.” Section 5 of the Federal Trade Commission Act also has prospective as well as post hoc reach. It has long been established that the FTC can challenge as an unfair method of competition prohibited by Section 5 any conduct that would be unlawful under the antitrust laws, as well as conduct that threatens to become a violation. Thus, in *FTC v. Motion Picture Advertising Servs. Co.*, the Supreme Court concluded that the Commission can proceed under Section 5 to prohibit in their incipiency practices that threatened to become a Sherman Act violation when fully grown. Subsequently the Supreme Court has repeatedly upheld Commission challenges under §5 without requiring proof of market power or anticompetitive effects, affirming FTC’s “power under § 5 to arrest trade restraints in their incipiency.” Finally, the prohibition against attempted monopolization in Section 2 of the Sherman Act reaches incipient problems, condemning conduct that presents a dangerous likelihood of successful monopolization. As Justice Holmes observed in *Swift & Co. v. United States*,

"Where acts are not sufficient in themselves to produce a result which the law seeks to prevent--for instance, the monopoly--but require further acts in addition to the mere forces of nature to bring that result to pass, an intent to bring it to pass is necessary in order to produce a dangerous probability that it will happen… But when that intent and the consequent dangerous probability exist,

this statute, like many others and like the common law in some cases, directs itself against that dangerous probability as well as against the completed result."\textsuperscript{77}

A too-big-to-fail problem is one of layered contingencies. As explored above, one element of a too-big-to-fail problem is the broader economic context in which a company’s imminent threatened failure occurs. At the time when firms like AIG and Bear Sterns were rescued, many other economic problems of national scope had already gathered before the bail-out decisions had to be made. It is uncertain, if not doubtful, whether the bailout of any single firm would have been considered a pressing need had the surrounding circumstances been less threatening. In any event, a firm is only in the requisite sense “too big to fail” if it is very big and deeply integral to broader economic activity that depends upon it, and also if there are economic conditions surrounding the corporate crisis rendering the imminent failure unacceptably catastrophic. If AIG was too big to allow its demise in the fall of 2008 when these problems coalesced, was it also “too big” during the housing boom that was in full bloom just months earlier? Had it failed in 2006 would the United States have had any reason to intervene to prevent collapse? At what point along the pathway toward a full-blown catastrophe does the incipient problem become palpable enough to raise the specter of bail-outs or some alternative governmental intervention? By the same token, at what point could antitrust intervention, if it is available, be expected to kick in? The point of intervention would not be to punish or exact damages but to prevent catastrophe. Anticipating the contingencies involved, including the potential for an adverse turn of events in the broader economic context as well as the likely effects of a particular company’s interrelations with others in the event that it failed, poses significant problems for any intervention – from antitrust or other sources. But antitrust law, in particular, is limited by various doctrines that preclude intervention based on speculation.

Even the antitrust statutes with some preventive reach are of limited use in forestalling a catastrophic business collapse because the narrow range of possibilities against which post-Chicago substantive antitrust guards barely overlaps with the possibilities that a catastrophic potential failure portend. For antitrust incipiency statutes to intervene to avert a too-big-to-fail scenario would require the imminent threat of the right sort. Under existing antitrust laws that are based on Post-Chicago assumptions it is theoretically possible that that could happen, but it will be the unusual case to be sure. Section 2 and its prohibition against attempted monopolization seems of no possible application outside the coincidental circumstance in which a very big company is both headed for a train wreck and happens at the same time to be conducting its business with an unlawful intent and likely effect of maintaining or creating a monopoly. This will be the exceptional circumstance almost by definition: a company is unlikely to become a monopoly at the same time as it is likely to fail. The more plausible candidates for intercepting a too-big-to-fail failure are Section 5 of the FTC Act and Section 7.

\textbf{(iv) The Current Reach of Section 5 of the FTC Act}

\textsuperscript{77} 196 U.S. 375, 396 (1905).
Is it, or could it be, a violation of Section 5 for a company to engage in some form of risky conduct that poses a threat to its own survival and a strong possibility of governmental protection or bail out? If so, at what point in time along the continuum of events would that conduct rise to the level of an “unfair method of competition?” Is it “unfair” in the requisite sense for a firm to take unreasonable risks that its smaller rivals cannot afford to take given an imbalance in the likelihood of governmental rescue for the “too big” company?

Section 5 is an adaptable statute by its nature. It proscribes “unfair methods of competition,” which the Supreme Court has found to be a concept that is “flexible ... with evolving content,” and the Court has repeatedly held that the meaning of “unfair methods of competition” can be ascertained only on a case-by-case basis by the “gradual process of judicial inclusion and exclusion.” The results of judicial articulation of the concept have been inconclusive and spotty, but a few points have emerged. First, Section 5 prohibits whatever is also prohibited by the antitrust laws (subject to certain jurisdictional limitations of the FTC Act). However, Section 5 is not confined to conduct that violates antitrust law:

In the area of anticompetitive practices, the FTC Act functions as a kind of penumbra around the federal antitrust statutes. An anticompetitive practice need not violate the Sherman Act or the Clayton Act in order to violate the FTC Act. ... However, the scope of the FTC is nonetheless linked to the antitrust laws. The power of the Federal Trade Commission to declare anticompetitive trade practices “unfair” extends primarily to “trade practices which conflict with the basic policies of the Sherman and Clayton Acts even though such practices may not actually violate those laws.”

Thus conduct that for technical reasons may fall outside the reach of antitrust laws may violate Section 5, for example in invitation to fix prices where no agreement to do so is

---

Actually formed.\textsuperscript{82} Moreover, as long ago as 1972 the Supreme Court held that conduct that does not implicate antitrust law or policy may fall within the potential reach of Section 5.

Thus, legislative and judicial authorities alike convince us that the Federal Trade Commission does not arrogate excessive power to itself if, in measuring a practice against the elusive, but congressionally mandated standard of fairness, it, like a court of equity, considers public values beyond simply those enshrined in the letter or encompassed in the spirit of the antitrust laws.\textsuperscript{83}

The sweep of Section 5 “unfair methods of competition” covers, for example, a company using deceptive advertising, intentionally or not, which other companies complying with the Act do not use, thus creating an unfair advantage over its competitors.\textsuperscript{84} Conduct that is legally proper, such as bringing lawsuits in courts of proper venue, has been held to be an unfair method of competition where the defendants in those lawsuits were consumers who were disadvantaged by having to travel long distances to defend themselves against the defendant corporation’s charges.\textsuperscript{85} Section 5 has been regarded as a broad grant of authority that affords the agency power to intervene to protect the public against practices that may defy categorization. However, courts have imposed limitations on the scope of Section 5 in the interest of predictability, especially where the conduct is outside the reach of antitrust laws. Where “unfairness” is applied to conduct that is not measurable by unfairness standards under other statutes, “standards for determining whether it is ‘unfair’ within the meaning of § 5 must be formulated to discriminate between normally acceptable business behavior and conduct that is unreasonable or unacceptable.”\textsuperscript{86}

The conduct that creates a too-big-to-fail problem can fall into an infinite variety of categories, some of which, at least, might theoretically be reachable by Section 5 intervention. First, of course, growth is often accomplished by mergers and acquisitions. The antitrust standard for such transactions is only implicated where market power is increased, but Section 5 could reach further. For example the FTC might block a conglomerate merger on the ground that the scale efficiencies or other putative benefits from the combination were more than offset by looming indispensability problems, particularly if the moral hazard created by the merger gave the merging firms an unfair advantage over smaller rivals who could not rely on bailouts. The market extension mergers in the banking industry are, again, an excellent example. Suppose that Bank A is the dominant commercial bank in Region A, and it acquires Banks B, C and D that each dominate in their respective Regions B, C and D. By hypothesis, none of these banks

competes with the others so the merger is not horizontal and would be unlikely to provoke any resistance under Section 7. The failure of pre-merger Bank A standing alone might pose a significant but manageable clean-up problem for the Federal Reserve System, but at some point, if Bank A merges with enough dominant banks in enough geographic markets that will no longer be the case. Eventually market extension mergers can and do create banks that cannot be allowed to fail. If it is additionally supposed that it would be economically rational for post-merger Bank A to take advantage of its too-big-to-fail status, such as by engaging in high-risk-high-return lending on a global scale with the expectation of federal rescue if risks materialize, is that an “unfair method of competition?” If so, are the mergers that position Bank A to engage in that unfair method of competition also unfair, or is it too speculative even for the incipiency standards of Section 5? There is no case authority to resolve this, but at least one current Commissioner believes it is a plausible application of Section 5, albeit a controversial one.

(v) Consolidation, Efficiency and The Current Reach of Section 7 of the Clayton Act

The principal federal statutory provision governing mergers is Section 7 of the Clayton Act, which provides:

No person engaged in commerce or in any activity affecting commerce shall acquire, directly or indirectly, the whole or any part of the stock or other share capital and no person subject to the jurisdiction of the Federal Trade Commission shall acquire the whole or any part of the assets of another person engaged also in commerce or in any activity affecting commerce, where in any line of commerce or in any activity affecting commerce in any section of the country, the effect of such acquisition may be substantially to lessen competition, or tend to create a monopoly.

As currently understood, Section 7 of the Clayton Act represents no particular objection to size, and is instead concerned with combinations that create market power or facilitate its exercise. Policy makers have sometimes toyed with the idea of limiting mergers of large and leading companies, but those proposals have not been implemented or enacted into law. Indeed, the failed attempts to outlaw mergers exceeding specified size

87 For purposes of antitrust analysis, geographic market extension mergers are essentially no different from product market extension mergers. In 1998, for example, Citi Group acquired Travelers, extending its banking business into the business of insurance.
88 Rosch, supra.
90 For example, The White House Task Force Report on Antitrust Policy (“Neale Report”) (1968) recommended limiting certain acquisitions by firms having $250 million in sales or $500 million in assets of leading firms in concentrated markets; in 1979 a bill was introduced in the Senate that would have prohibited mergers between a companies
thresholds makes clear that existing law does not prohibit such transactions.\textsuperscript{91} Section 7 instead limits aggregations of market power, rather than size – and the two do not correlate both because very large mergers are thus permitted in very large markets, and because conglomerate mergers can be very large without affecting concentration in any relevant economic market.

The most influential interpretation of this broadly-worded statute is embodied in federal agency guidelines rather than judicial opinions, largely because the Supreme Court has only rarely taken cases that would allow it to expand on the statute’s meaning.\textsuperscript{92} As the Merger Guidelines make clear at the outset: “The unifying theme of the Guidelines is that mergers should not be permitted to create or enhance market power or to facilitate its exercise. . . . [T]he result of the exercise of market power is a transfer of wealth from buyers to sellers or a misallocation of resources.”\textsuperscript{93} The evaluation of the legality of a merger under the 1992 Guidelines, which is also generally followed by the courts, proceeds by defining the relevant markets in which the transaction may increase concentration and then measuring its concentration effects, taking certain defenses and justifications into account as to transactions that otherwise exceed stated permissible concentration thresholds. Nothing in the case law or the 1992 Guidelines addresses the problem of unwieldy size or the possibility that the resulting firm might wield intolerable political power or present unacceptable risks of its own failure. Size is not any part of a basis for disapproving a merger under the Guidelines analysis and so it is no surprise to find that mergers of enormous size are routinely approved by antitrust enforcers and federal courts applying Section 7.

One increasingly important defense is the presence of merger-specific efficiencies because scale efficiencies in particular are a central articulated motivation for many

\textsuperscript{91} In response to the current crisis, legislation has been proposed to enable regulators to dismantle or impose discipline on any firm that poses a too-big-to fail risk. A proposal by Congressman Kanjorski of Pennsylvania would empower a newly-created financial industry regulatory Council to make determinations about the size, scope of operations, business relationships and interconnectedness, and mix of activities of the largest financial services businesses and to impose, among other things, divestiture to unaffiliated companies upon a finding of systemic risk. Amendment to the Committee Print of October 29, 2009, offered by Mr. Kanjorski of Pennnsylvania. (Hereinafter, “Kanjorski Bill”) This provision would not amend Section 7 but might cast a different light on it.

\textsuperscript{93} Merger Guidelines at §0.1.}
mergers. At one time, efficiencies justifications for mergers were largely ignored on the ground that even the most anticompetitive transactions will create some efficiencies. In 1967 the Supreme Court held that “possible economies cannot be used as a defense to illegality, observing that “Congress was aware that some mergers which lessen competition may also result in economies but it stuck the balance in favor of protecting competition.”94 Intervening years and the emergence of the Chicago School brought an increased tolerance of potential anticompetitive effects that are now regarded as potentially offset by merger specific efficiencies. In 1997, the Federal Trade Commission and United States Department of Justice expanded the efficiencies provisions of the Merger Guidelines in an effort to delineate how the agencies will evaluate claimed efficiencies and balance them against potential adverse competitive effects from mergers.95 An FTC study published in 2009 reviewed the agency’s experience with efficiencies justifications that had been proffered for mergers over a ten-year period.96 Of 118 mergers that were the subject of Bureau of Competition staff memoranda, 50 transactions presented at least one efficiency-related justification.97 Efficiencies arguments fared reasonably well at the agency, with the Bureau of Competition accepting roughly 27% of all efficiencies justifications advocated for merger transactions during the study period.98

While efficiencies of scale are considered in approving transactions, inefficiencies of scale are not, so that mergers resulting in inefficiently large scale are not on that particular ground disapproved. It is likely that at least some mega-mergers have had adverse effects on overall efficiency by creating out-sized firms, but antitrust hardly puts in place an “inefficiency filter” to block big mergers that do not create or enhance the exercise of market power even if the merged firm is simply unwieldy. For example, certain high-profile mega-mergers have proved to have been ill-conceived and inefficient, such as AOL’s $182 billion merger with Time Warner in 2001. The combination was touted as creating a digital media powerhouse with the potential to reach every American with a computer or a television set. The Federal Trade Commission approved the merger under a consent decree that sought to prevent Time Warner from exploiting market power in broadband by discriminating or denying access in connection with its cable system, which serviced roughly 20% of U.S. households. The concept of the merger proved to be so ill-advised that within five years Time Warner could not find a buyer for AOL and was forced to spin off the failed internet access and online advertising business. The

98 Id. at P. 35. Data were also reported for the Bureau of Competition, which reached substantially similar results although there was some disparity between the two wings of the agency. Acceptance or rejection of efficiency defenses by either Bureau was not necessarily reflected in the ultimate determination by the agency itself.
combined assets did not work efficiently together. One can of course debate whether the Federal Trade Commission’s *ex ante* review (or the parties themselves) should have anticipated the inefficiencies inherent in that transaction, but even if it had current antitrust law would have offered it no such ground on which to oppose it.

There is at least some scholarly support for the proposition that many mega-mergers in the United States and globally in recent years have created outsized firms far surpassing efficient scale, resulting in unwieldy and inefficient rather than more competitive enterprises. In many industries including financial services, minimum efficient scale has increased over time along with technology advances, deregulation and other developments. However, it seems likely that merger size has grown at a much larger rate, casting some doubt on the notion that bank mega-mergers are generally necessary to achieve scale efficiencies. As long ago as 1993, a scholarly assessment of merger activity in the banking industry concluded that x-efficiency, or managerial ability to control costs, played a substantially greater role than scale efficiencies in the overall performance of banks, and that bank mergers often did not yield any scale efficiencies at all.99 Similar observations are echoed in subsequent scholarly assessments of consolidation and efficiency in financial services markets.100 One study concluded: “Ex post results of M&As seem to contradict the motivations given by practitioners for consolidation, which are largely related to issues of economies of scale and scope and to improvements in management quality.”101 Mega-mergers are more or less routine, and have rarely been blocked by antitrust agencies, at least not since the much-disparaged cases like *Von’s Grocery* three decades back.102 In 2008, for example, Anheueser-Busch’s $52 billion acquisition of InBev topped the list of mergers exceeding $2 billion.

Notwithstanding credible arguments that some mega-mergers deliver scale *inefficiencies*, Section 7 as it is currently understood does not put the courts or agencies in a position to second-guess the desirability of a merger that is otherwise lawful. Horizontal mergers of enormous size are not objectionable under current standards, which are quite relaxed by comparison with historic standards or even standards imposed in certain other jurisdictions. Furthermore, by definition conglomerate mergers do not aggregate horizontal market power and are essentially beyond the reach of Post-Chicago antitrust law. Conglomerate mergers can therefore create behemoth enterprises of ungainly and inefficient proportions with impunity. An efficiencies defense might be of interest for certain horizontal mergers, but no defense based on efficiency or otherwise is required or even relevant to a merger that does not increase concentration or pose a vertical

---

101 D. Amel *et al.* supra.

foreclosure problem. Conglomerate and market extension mergers do neither. Thus existing antitrust law approach to mergers and acquisitions could do almost nothing to prevent the accumulation of resources into a poorly positioned firm whose own failure would also risk broader systemic failure.

It therefore can be concluded that Post-Chicago antitrust is not a public policy weapon of much use in preventing too-big-to-fail problems. As a general matter, Post-Chicago economics is concerned more about over-deterrence than under-deterrence, embodies *laissez faire* tendencies relying on markets to self-correct, and most importantly concerns itself exclusively with applying antitrust law to enhance allocative efficiency to the virtual exclusion of other societal values. The too-big-to-fail problem barely intersects with the problem of optimizing allocative efficiency and for the same reason barely invites antitrust intervention of any sort. The only limitation on this conclusion is the possibility that Section 5 of the FTC Act might sometimes be invoked to prevent or dismantle an out-sized merger that created a substantial likelihood of “unfairness” based on a rational economic expectation that the merged firm would operate under presumed bail-out protection.

4. *Could Antitrust Law Help?*

Since Post-Chicago antitrust has very little to contribute in combating the too-big-to-fail problem, the natural question becomes: *could* antitrust do a better job without doing violence to fundamental doctrine? This is a particularly difficult question to respond to because it has never been altogether clear what “fundamental antitrust doctrine” comprises. Indeed antitrust doctrine has shifted around over time. However, antitrust at one time had a broader reach than it currently does, and the very dynamism of antitrust law could in theory free up courts to restore some or all of that earlier reach or perhaps even to give antitrust another new face, as was done by the Chicago School revolution. Also, whatever “fundamental antitrust doctrine” means, it ought to at least include the important and uncontroversial advances that the law made in response to advances made in the field of economics. That is, “restoring” antitrust should not, for example, reverse course to declare (again) that all vertical territorial exclusivity agreements are *per se* illegal. There does not seem to be any real debate among economists about the potential efficiencies from such arrangements, so that reversing course on that point would be counterproductive. On the other hand, antitrust law at one time was more directly at odds with highly concentrated market structures and it might restore some of that distrust without ignoring advances in economics. If, as is probably the case, many too-big-to-fail companies are in markets that are highly concentrated (the measurement of which in turn might be open to redesign), then perhaps prophylactic antitrust rules could be fashioned to forestall at least some systemic failures. Given the very high costs of the recent systemic failures, it might be worth imposing such newly-fashioned antitrust rules even at some more modest expense in terms of efficiency. Moreover, efficiency claims made by some too-big-to-fail firms lack much empirical support or even prima facie plausibility, and so the social costs of dismantling a few potentially catastrophic firms may be less than advertised in some quarters. Finally, there is not reason in principle why antitrust must remain rigidly devoted to economics-based policy as its sole source of direction.
There is also a substantial difference between preventing and curing too-big-to-fail problems. Even current antitrust law ought to help make corrections when markets have failed. It is not surprising that the Assistant Attorney General for Antitrust Christine Varney tenure concluded in the midst of the recent crisis that: “First, there is no adequate substitute for a competitive market, particularly during times of economic distress. Second, vigorous antitrust enforcement must play a significant role in the Government’s response to economic crises to ensure that markets remain competitive.” As Professor Maurice Stucke observes (echoing many others), “antitrust enforcement is not a luxury reserved for more prosperous times.”

So antitrust might play an important curative role after a too-big-to-fail crisis. If restoring competition in the wake of collapse is an important public policy tool for redressing the problem, it also seems well worth considering whether the enforcement of competition law in advance might not play a preventative role.

**a. Harnessing the Dynamism of Antitrust**

Antitrust law cannot help avert the need for too-big-to-fail bailouts unless it adapts to address some of the sources of the problem. However, antitrust is a legal system whose rules are formed and applied with very specific reference to the policies underlying the law – and those policies have proved to be dynamic, subject to dramatic changes over time in response to the evolving economy, developments in the related field of economics, as well as social and political trends. As policies have changed, so have antitrust rules. There is no reason to believe that antitrust law has settled once and for all upon Post-Chicago policy and theory. Indeed, the history of antitrust policy is instructive as to just how unlikely that is.

It has never precisely clear what public policies are embodied in the nation’s antitrust laws, even today, but clearly antitrust policy has been anything but stagnant. While some adherents of the Chicago School have advocated an exclusive focus on consumer welfare defined as allocative efficiency, it has been correctly observed that the courts including the Supreme Court have never gone that far. Moreover, there have been broad historic shifts in antitrust policy. It evolves, sometimes through legislative reform, sometimes by judicial reinterpretation, and at other times by policy statements of federal and state enforcement agencies. Indeed, United States antitrust law has had a rich and varied history in Congress, the courts and enforcement agencies. Tracing shifting policy underpinnings in detail through time is complex and beyond the scope of this article, but it is important here to understand how modern antitrust law came to sharpen and

---

105 For an interesting summary of the evolution of antitrust policy, see Hovenkamp, op. cit.
narrow its focus on the objective of allocative efficiency, or consumer welfare, and how momentous a policy shift was required to bring us to the narrow post-Chicago approach.

Antitrust as a legislative response to large enterprise has a particularly significant and uneven history. The current policy devotion to allocative efficiency is neutral or positively favorable with regard to bigness but antitrust policies of an earlier era were very much concerned with a variety of dangers believed to be posed by the presence of large corporations in our economy. The early sweeping construction of the Sherman Act mirrored the prevailing public fear and mistrust of large corporations. In fact, the name “antitrust” derives from the peculiar form of business organization, the “trust,” that was used to circumvent the constraints of 19th Century state corporations codes in order to aggregate large business enterprises under unitary control. 19th Century state corporations statutes never contemplated anything as large or far flung as the trusts. Early in the 20th century the Supreme Court overruled Trans-Missouri Freight and introduced the “rule of reason” in its controversial Standard Oil decision, which was perceived at the time as limiting the reach of the law – although notably the decision broke apart the Standard Oil trust. A few years later in 1914 Congress passed what many regarded as remedial legislation in the Clayton Act. In the 1921 decision in United States v. American Can Co., the District Court reaffirmed the prevailing view that antitrust law was designed to address “a public danger” from big business, and a preference therefore for smaller ones:

If it be true that size and power, apart from the way in which they were acquired, or the purpose with which they are used, do not offend against the law, it is equally true that one of the designs of the framers of the Anti-Trust Act was to prevent the concentration in a few hands of control over great industries. They preferred a social and industrial state in which there should be many independent producers. Size and power are themselves facts some of whose consequences do not depend upon the way in which they were created or in which they are used. It is easy to conceive that they might be acquired honestly and used as fairly as men who are in business for the legitimate purpose of making money for themselves and their associates could be expected to use them, human nature being what it is,

106 United States v. Trans-Missouri Freight Ass’n, 166 U.S. 290 (1897).
107 Standard Oil Co. of New Jersey v. United States, 221 U.S. 1 (1911). The Court in Standard Oil sustained a decree that required the dismantling of the Standard Oil trust, but the rule of reason announced in the case was regarded by Progressives and others as weakening the law. Justice Harlan’s dissent exclaimed that “the action of the court in this case might well alarm thoughtful men who revered the Constitution.” Id. at 104.
and for all that constitute a public danger, or at all events give rise to difficult social, industrial and political problems.\textsuperscript{109}

In the decades following, enforcement priorities were mixed, with relatively lax attention to industrial concentration\textsuperscript{110} but more aggressive enforcement against certain forms of unfair or exclusive conduct such as resale price maintenance,\textsuperscript{111} exclusive dealing,\textsuperscript{112} and anticompetitive trade association activity.\textsuperscript{113} In the 1930s and 1940s, following a brief relaxation of antitrust rules under the Codes of Fair Competition,\textsuperscript{114} federal antitrust enforcement expanded to attack monopolies,\textsuperscript{115} vertical integration,\textsuperscript{116} and various forms of tacit collusion.\textsuperscript{117} At its extreme, the preference for small enterprise was embodied in the enactment of the Robinson-Patman Act when large supermarket chains emerged onto the national landscape.\textsuperscript{118} Beginning around 1950 with the enactment of the Cellerkefauver amendments to the Clayton Act,\textsuperscript{119} federal antitrust policy became explicit in regarding large enterprise with some degree of suspicion. In Brown Shoe Co. v. United States, the Supreme Court explained the Celler-Kefauver amendments as stemming from “a fear of what was considered to be a rising tide of economic concentration in the American economy,” and recited an array of public policies behind that enactment, including economic efficiency, inherent dangers of unchecked corporate expansion,

desirability of local control over industry, protecting small business, and “the threat to other values” aside from economic ones. In the 1950s and 1960s, influential economists fueled the most aggressive period of antitrust enforcement against industry concentration, believing that market structure drove marketplace performance, ultimately culminating in the 1968 Justice Department Merger Guidelines.

In addressing the too-big-to-fail issue, it is thus important to recognize that as recently as the 1970s, the antitrust laws were still understood by at least the courts and some leading scholars to promote a rich mix of social, political, and economic objectives. These included advancing economic efficiency, innovation, and consumer welfare; the protection of individual traders and their business freedom against certain kinds of private interference; the prevention of antidemocratic political pressures that might flow from concentrations of economic power and wealth; limiting wealth transfers from consumers to monopolies and cartels; and (at various times and in varying degrees) limiting the growth of big business as an end in itself. In 1979, Professor Walter Adams testified in the United States Senate to say: “The objective of antitrust is not to promote efficiency and consumer welfare. These are only ancillary benefits that are expected to flow from economic freedom. The primary purpose of antitrust is to perpetuate and preserve, in spite of a possible cost, a system of governance for a competitive free-enterprise system.”

Some of these policies do not seem so far removed from the too-big-to-fail problem. The preference for small over large enterprise as an end in itself bears directly on the matter. Similarly, the preference for local control over industry, the desire to protect small business men and women from oppression from gigantic corporations, and protecting democratic institutions from the corrupting influence of concentrations of wealth and economic might all speak to the problem. Indeed, it may be that the emergence of a too-big-to-fail enterprise violates every single policy that has ever been mentioned in connection with the Sherman Act other than allocative efficiency. Moreover, it can also be argued that even the more strictly economics-driven underpinnings of antitrust have unnecessarily ignored the problem of corporate size by ignoring diseconomies of scale, allowing conglomerate and market extension merger activity even where consumer

welfare may be harmed by shifting resources into ungainly enterprises and squandering the output, price and innovation advantages of smaller enterprise. Given the dynamism of antitrust law and policy, there is good reason to consider a new dynamic shift.

b. Was the Paradox Really So Bad?

Of course, it is one thing to note that antitrust policy is dynamic enough to adapt to the too-big-to-fail problem, but quite another to conclude that it ought to. There are many good reasons why the older order of antitrust broke down and gave way to the Chicago School. However, some of those reasons now seem to have been overstated, and the antitrust “paradox” that launched the Chicago School antitrust movement has its own problems. Robert Bork successfully advocated that pre-Chicago School antitrust policy was paradoxical and “at war” with itself, arguing that there had never been any policy underpinning to antitrust other than allocative efficiency and that by embracing other policies courts had created an internally inconsistent law that sought to promote efficiency but also rewarded inefficient firms with viable antitrust claims. But was it really so bad for a statute with the breadth and importance of the Sherman Act to embrace multiple policies that sometimes are in tension with one another? Even if the answer is yes, which is not clear, was abandoning all antitrust policies aside from allocative efficiency really always in the best interests of consumers, or were Bork’s laissez faire achievements instead in the interests of the corporations to which consumers turn for goods and services? Finally, have laissez faire policies themselves led to the paradoxical result that government ultimately has been forced to take a greater role in the private sector?

It was an overstatement to say that antitrust never was concerned with anything except allocative efficiency or that antitrust policy never objected to large enterprise for other reasons. In fact that assertion behind the Chicago School argument is bizarrely at odds with history. Justice Harlan had described the Sherman Act nearly 100 years ago as arising from a universal conviction that “the country was in real danger from another kind of slavery… that would result from the aggregations of capital in the hands of a few….” That was not a statement about allocative efficiency. As discussed above, the first 100 years of antitrust jurisprudence can be seen to contain an unwavering commitment to a number of competing policies, sometimes acknowledged to be in tension with one another.

Furthermore, it is arguable that laissez faire policies indeed yielded a paradox of their own by bringing about the recent need for massive government intrusion into the private sector. In what has turned out to be a prescient warning about the perils of the then-emergent Chicago School, in 1979 Robert Pitofsky wrote:

> It is bad history, bad policy and bad law to exclude certain political values in interpreting the antitrust laws. By ‘political values,’ I mean, first, a fear that excessive concentration of economic power will breed antidemocratic political

pressures, and, second, a desire to enhance individual and business freedom by reducing the range within which private discretion by a few in the economic sphere controls the welfare of all. A third and overriding political concern is that if the free-market sector of the economy is allowed to develop under antitrust rules that are blind to all but economic concerns, the likely result will be an economy so dominated by a few corporate giants that it will be impossible for the state not to play a more intrusive role in economic affairs....

This final prediction could not have been more accurate. The emergence of a few corporate giants that were left to take under-regulated risks and to grow without significant government intervention eventually forced the United States government to become the largest investor in the U.S. automobile industry as well as a controlling owner of some of the largest banks and other financial institutions in the country, and to infuse hundreds of billions of dollars into private financial sector in the forms of equity investments, loans and loan guarantees. Federal funds also have been infused into the home mortgage refinance marketplace to forestall foreclosures. All of this bail-out activity of course came with unavoidable pressures for governmental control on a range of private enterprise decision making, even including management compensation. More government intervention of a more durable sort also seems inevitable as Congress and regulatory agencies respond to a stinging public backlash against a government that is perceived (rightly or not) to have let the country’s booming economy disintegrate. Federal and state regulation has been enacted or is under consideration addressing dozens of areas of economic activity including real estate mortgage lending practices, trading in derivatives and other securities, solvency of financial institutions, management compensation and corporate governance. All of this can in some measure be attributed to inadequate government oversight of sectors of economy that are “dominated by a few corporate giants.” Thus the new paradox: *laissez faire* policies that have led to unprecedented government intervention in the private sector.

Which paradox is really worse? One problem with myopic attention to allocative efficiency is that consumers could be worse off if firms must be too big to fail in order to achieve optimum scale. The too-big-to-fail problem never figured into economic arguments for “letting the marketplace decide,” and it changes the equation. Suppose for the sake of argument that banks in the United States really need to be as big as the nation just permitted them to become in order to compete for one-stop-shopping corporate customers in the global financial services markets. That is, suppose that their current gigantic size has not yet crested optimum efficient scale. That does not necessarily mean that their gigantic size could not pose a threat of greater consumer harm than would follow from the marginal loss of scale efficiency that would result (by hypothesis, at least) if the banks were required to be a bit smaller. Certainly some consumer harm has resulted from the too-big-to-fail problem even if one assumes that these same firms were generating economies of scale as they claim. Commissioner Rosch is correct to note that

127 Housing and Economic Recovery Act of 2008 [cite], Housing Assistance Act of 200

the failure of a too-big-to-fail enterprise causes consumer harm in the form of reduced output, resulting in higher prices and possibly diminished innovation, and no one has ever measured those harms against whatever consumer benefits supposedly flow from allowing firms to become too-big-to-fail. Thus even if it would be a paradox of one sort to impose antitrust-based limits on some corporate size, it may equally be a paradox of another sort not to—even viewing antitrust myopically as concerned with nothing except output, price and innovation.

c. The Problem of Diseconomies of Scale

There is yet another paradox in Post-Chicago antitrust, or at least an inconsistency worthy of further study: optimum scale efficiency is considered measurable and a presentable basis for allowing a merger transaction, but excessive-scale inefficiency is not considered a proper basis on its own for disallowing a merger. That is, there has never been a merger blocked by a court or agency on the exclusive ground of scale diseconomies, let alone that the merged entity would be too big to fail—there has to be another basis for antitrust to intervene. The reverse is no longer true since the revision to the Horizontal Merger Guidelines in 1997.\textsuperscript{129} The Guidelines now provide for a quantitative assessment of merger specific efficiencies, and indicate that the agencies will consider such efficiencies as capable of offsetting some potential adverse competitive effects of a merger. Although the Guidelines acknowledge that efficiencies “are difficult to verify,” they invite merger proponents to “substantiate efficiency claims so that the Agency can verify by reasonable means the likelihood and magnitude of each asserted efficiency…” Nowhere do the Guidelines attempt to quantify or address the consumer harm that can result when a merger that is otherwise benign creates an out-sized merged enterprise of inefficient scale.

Diseconomies of scale can harm consumer welfare just as much as the prevention of economies of scale. Diseconomies of scale result when a firm’s marginal cost begins to exceed long-run average costs. This can occur when a firm’s size becomes so unwieldy that each additional unit of production costs more than the one before. Among the many causes that have been studied is the tendency for large organizations to isolate decision makers from the results of their decisions—a familiar theme in recent discussions about corporate compensation excesses divorced from performance measures. Other causes of diseconomies of scale in large enterprises include increased communications costs, duplication of effort, inertia, internal culture clashes, etc. By definition, when a firm exceeds optimum scale each additional unit produced by it costs more, and consumers pay the price for that. Why is it that optimal scale efficiency is measurable and a proper consideration to \textit{permit} a transaction and overcome some anticompetitive potential yet diseconomies of scale are not considered worthy of any sort of antitrust inquiry at all (other than perhaps to rebut claims of scale economies)?

This may add one more justification for antitrust to address itself to some too-big-to-fail problems. Although current antitrust rules do nothing to preserve smaller enterprise for

\textsuperscript{129} Department of Justice and Federal Trade Commission Horizontal Merger Guidelines (1992, revised 1997), at Section 4.
its own sake, even the narrowest economics doctrinal underpinnings may support doing so in some limited circumstances.

5. Conclusions

Antitrust is quintessentially addressed to the optimum organization of the nation’s economy, even if it does not purport to address all aspects of it. The central concern of antitrust law is economic power and its potential to be misused. Vast aggregations of economic power in convergence with other phenomena cause too-big-to-fail crises. It therefore stands to reason that antitrust ought to be concerned with some aspects of the too-big-to-fail problem at least insofar as the problem stems from aggregated economic size and power. Since the too-big-to-fail problem is complex it is unsurprising that antitrust is not alone the cure, but it could make a difference by controlling certain forms of conduct that lead to firms becoming excessively large.

The foregoing considerations lead to a few conclusions and proposals for bringing antitrust into the public policy discussion about preventing or limiting the need for public rescues of private firms that are too big, too interconnected and perhaps too powerful to be allowed to fail.

a. Existing Antitrust Merger Law Could Help Prevent Some Out-sized Combinations

Antitrust law reaches a range of business practices, and many of them (such as price discrimination) are unlikely ever to have any role in the creation of a too-big-to-fail crisis. The most relevant prohibitions relate to mergers. Although some firms become too-big-to-fail by internal growth, the public has at times been forced to rescue some firms that grew by merger activity. It is perfectly appropriate for antitrust law to consider whether a merger transaction threatens consumer harm. The 1992 Horizontal Merger Guidelines are currently under review, and some attention might be paid in the final product to the problems related to combinations that create merged entities that are too big to fail. Although too-big-to-fail is not central to most merger analysis, enormous consumer harm has resulted from allowing corporate growth to create so many indispensible firms. Put differently, since size contributes to the problem, controlling size might contribute to a solution. There are a few ways in which antitrust law might more assertively intervene to control the population growth in the too-big-to-fail category of businesses.

(i) Diseconomies of Scale in Merger Analysis

Mergers could be reviewed under a modified standard that took into account the possibility that the merged entity will simply be too big measured by its own economics. Since consumer harm in the form of higher prices and reduced output can result from allowing a firm to achieve a scale that exceeds the optimum, here is one place where antitrust might play a role without much adaptation from its current approach. This is a controversial proposal, to be sure, because at least the Clayton Act only prohibits combinations whose effects “may be substantially to lessen competition or tend to create
a monopoly,” and theoretically a firm could exceed optimum scale without doing either of those things. There will also be disagreement about what constitutes efficient scale, as is already a matter of public debate about the size of the nation’s four largest banks. Still, sometimes a firm’s becoming very large and inefficient will dampen competition and place upward pressure on prices, and that should be of concern to antitrust agencies and courts.

Another objection would be that the government ought not intervene in the entrepreneurial process by dictating optimum scale instead of allowing the marketplace to decide. If a firm decides to grow to a certain size in the hope of obtaining competitive advantage, it may be argued that the government should not determine that such a marketplace gamble is inefficient. Notably, other types of likely inefficient results of mergers are already taken into account in orthodox merger review. For example, it is understood that a profit maximizing monopoly may be willing to spend resources inefficiently to retain its monopoly position, such as through various forms of costly predation, so long as the costs do not exceed the monopoly profits. Also, those who will argue that the government has no business deciding the optimum scale of private enterprise need to explain why the efficiencies provisions added to the 1992 Guidelines do not run afoul of the same principle. If economists can take measurements to assure the public that a business combination will achieve scale efficiencies sufficient to offset presumptive monopoly power, they ought equally to be able to warn the public that another merger would move the combined firm beyond the optimal scale. The standard analysis of merger-specific efficiencies is a complex one, but its basic arithmetic is simple enough: the presumptive monopoly deadweight welfare loss is calculated to be a number that is less than the combined firm’s reduction in cost-per-unit times the number of units produced. The converse should be no more difficult or speculative. Of course, just as scale efficiencies are difficult for merger proponents to quantify, those opposing a combination on inefficiency grounds should bear a similar burden. It may often be the case that the burden turns out to be too great, in which case a diseconomies of scale filter would do no good. But neither would it appear to do any harm and it might prevent some out-sized combinations that create inefficient firms.

(ii) Too-Big-To-Fail as a Factor in Merger Analysis

A second proposal that would entail little or no adjustment of current antitrust economics dogma is to incorporate the too-big-to-fail problem itself into merger review standards. This was Commissioner Rosch’s idea, which he acknowledged to be a provocative one. However, the controversy is not one about the basic economics of Post-Chicago antitrust. Assuming a merger presents a palpable prospect of creating a firm that cannot be allowed

130 The Federal Trade Commission Act §5 is not limited by the language of the Clayton Act.
131 Under the 1992 Merger Guidelines, the efficiencies “defense” only comes into play where the transaction is presumptively anticompetitive based on the structural and behavioral analysis set forth in the Guidelines. This means that efficiencies as a defense is only calculated where there is at least a presumption of post-merger market power sufficient to reduce output, raise prices and thus create a monopoly “deadweight welfare loss.”
to fail under conditions where failure can be foreseen, the threat of antitrust-type consumer harm from the transaction may meet the standard of incipience under Section 7 of the Clayton Act or Section 5 of the FTC Act. For example, the recent banking industry mergers that were permitted as a sort of private bail-out of the acquired banks could be analyzed along these lines. In appropriate cases it would seem to do no violence to current Post-Chicago antitrust law and policy to block such mergers on that ground, since consumer harm via reduced output, higher prices and impaired innovation are uncontroversial objects of antitrust sanctions. Again, quantifying the threat to consumer harm may be daunting and the burden of establishing such a likelihood should not be a light one since the likelihood that any particular firm will at some point in the unforeseen distant future meet all of the criteria of a too-big-to-fail enterprise should not be expected to be a routine conclusion. A firm might present only a very remote too-big-to-fail threat at the time it proposes a merger, and that threat might not materialize until later after it is too late for antitrust intervention under existing antitrust theory. One can anticipate any number of problems, but the concept remains a sound one: allowing firms to merge into a size that could not be allowed to fail through normal bankruptcy proceedings presents a threat to consumer welfare that is indistinguishable in character from the harms that flow from mergers we already block for other reasons. If one of the nation’s four largest banks proposed to combine with another large financial services firm, would it be too much to ask whether a non-publicly funded resolution is feasible if their liabilities were to become unmanageable? It is the rare merger that ought to present such a question, and in those few contexts the question seems an appropriate one to consider.

b. Toward a Partial Restoration of Antitrust Policy

It is time to set aside the myth that antitrust law has always had as its sole objective the optimum allocation of productive resources; to restore to antitrust the policies that were jettisoned by the Chicago School; and to include reference to these broader policies in formulating and applying antitrust rules. It is modern mythology to suggest that antitrust was never intended to limit the economic and political power of the trusts. That myth was merely one of the arguments, and not the most forceful, for moving antitrust into a laissez faire posture that trusted markets to make better decisions than the courts or agencies. The primary Chicago School objection to older antitrust policy, the real “antitrust paradox,” was that it rewarded inefficient market participants with antitrust remedies exacted from their more efficient rivals. That paradox does not need to be revived. What ought to be reconnected with antitrust rules are those policies that were directed at protecting consumers, the freedom of traders, democratic institutions and the economy against the perils of excessive concentrations of corporate economic power. Courts and agencies never explicitly repudiated non-economic antitrust policy objectives, but they have ignored and at times disparaged them. Competitor collaborations, conduct of monopolies and potentially catastrophic mergers should be subject to antitrust review that takes these other policies into account.

The too-big-to-fail public policy problem overlaps almost not at all with allocative efficiency concerns, but it intersects directly with these other antitrust values. Perhaps the core value of antitrust is its preference for marketplace activity to serve well the needs of consumers. When firms are rescued by public bailouts, the government almost
inevitably must intrude into the machinery of the marketplace – just the result antitrust seeks to avoid. That alone would form a reasonable basis for objecting on antitrust grounds to the formation of a too-big-to-fail firm. Thus a central tenet of antitrust should favor some control to prevent the combination of firms into too-big-to-fail companies whose indispensability poses a risk of displacing normal marketplace activity with ad hoc crisis-driven government intervention. When a proposed merger would create a firm that would exceed maximum optimal scale and whose failure, if it occurred, would foreseeably require government bail-out intervention, antitrust ought to block the transaction.

Furthermore, antitrust’s political policy recognizes a threat to democratic institutions that has considerable resonance today. When firms become so large that they cannot be allowed to fail, they tend also to have disproportionate power over the political process. There is at least a perception that the mega-banks formed via a combination of bail-outs and mergers have paralyzed the effort to reform financial services regulation in Congress. A Pulitzer Prize-winning columnist for the New York Times observed: “Three years into the crisis, we are no closer to reining in too-powerful-to-fail companies or eliminating the risks that they pose to taxpayers.”

Antitrust also seeks to protect the freedom of traders to do business without anticompetitive interference or exclusion from the marketplace. Klor’s makes a most interesting case in point. That case involved allegations that a rival retailer formed a conspiracy with manufacturers to boycott and ruin the plaintiff. The boycott was held to fall within the per se prohibitions of Section 1 of the Sherman Act. Yet Klor’s was a single retailer in a competitive market served by sufficiently many others so that no allocative efficiency justification exists for the result in that case – an observation others have made. Indeed, the complaint under review in that case might not withstand a motion to dismiss under the newer standards for Rule 12 in force today, since it was implausible that the manufacturers would have any incentive to collude with one another to exclude a customer from the market. In any event, on the Post-Chicago view of things Klor’s was wrongly decided because consumers were not harmed by having one less retailer in a densely populated retailer marketplace. Still, what is objectionable about a rule that prohibits rivals from joining together to force another enterprise out of business, even if consumers do not pay higher prices as a result of the exclusion? Assuming the truth of the allegations, Klor’s was deprived of the freedom to conduct business. Until the Chicago School, a public policy against the very deprivation of freedom formed a part of anti-monopoly law since at least the Case of Monopolies in 1603.

market, it seems a reasonable public policy and a time-honored one to give the victim a remedy at law, regardless of whether consumers paid higher prices as a consequence.

The policy of protecting the freedom of traders also has a part to play in the too-big-to-fail discussion, because the moral hazard problem places the mega-enterprise at a distinctly unfair advantage that could prevent smaller rivals from thriving. How, for example, could a small bank offer competitive terms on credit transactions if its largest rivals in the same market have the ability to take risks whose downside potential is backed by the United States Treasury? This policy, if considered, would bring yet another consideration into play in evaluating a small number of mergers that present a plausible too-big-to-fail risk.

c. **Legislative Possibility**

It would be consistent with the original intent of the Sherman Act, and certainly with intervening enactments such as the Celler-Kefauver amendments to the Clayton Act, to consider further amending antitrust law to block the formation of a too-big-to-fail firm on that ground. It might move antitrust in a novel direction to go further and amend the Clayton Act to permit the break-up of a firm that has grown to such proportions. These sorts of legislative enactments are under consideration, and it is beyond the scope of this article to draw a conclusion as to whether public policy would be well or ill served by their enactment. However, if a too-big-to-fail statute were to be enacted, the foregoing discussion suggests that doing so would only do violence to very recent antitrust orthodoxy, but would not offend historic and original policies behind American antitrust law. The presence of these oversized enterprises, whose numbers are growing, is a threat to the political system because their indispensability makes them nearly impossible to govern; it threatens important markets with the uneven playing field created by the moral hazard problem; and it threatens unusually catastrophic harm to vast numbers of consumers and the public treasury. These are concerns that are not new to antitrust.
