Welcome:	Commissioner Jon Leibowitz	5
Welcome:	Christine Varney	11
Panel 1:	Overview, Historical Perspectives, Role of the Guidelines	12
Panel 2:	Direct Evidence of Competitive Effects	77
Panel 3:	Market Definition	136
Panel 4:	Unilateral Effects	185

1 P R O C E E D I N G S

2 MR. FARRELL: Good morning. I'm Joe Farrell.
3 You're going to be welcomed by the Chairman and the
4 Assistant Attorney General in just a moment. I'm doing a
5 pre-welcome which consists of telling you about security.
6 Those of you from outside the agency know all too much
7 about security already this morning, I guess. But I'm
8 asking to read you the following.

9 First of all, if you go outside the building
10 and you don't have an FTC badge and you want to get back
11 in, you have to go through security again.

12 Second, if there's a fire or evacuation, please
13 leave the building in an orderly fashion. Outside the
14 building, go across the street to the Georgetown Law
15 Center, look to the right front sidewalk -- I'm not sure
16 whether that's right as looked at from here or from
17 there. That's our rallying point. So, rally there.

18 And if it's perceived to be safer to remain
19 inside, you will be told where to go inside the building.
20 And if you spot suspicious activity, please alert
21 security.

22 Those are the security briefing. I have two
23 other logistical comments. One is there are cards for
24 questions at the back of the room. If you have questions
25 for panelists, please write them on the cards and pass

1 them up to the moderator.

2 And, secondly, outside, there are copies of the
3 1992/1997 Horizontal Merger Guidelines and you might be
4 interested in those. And there's also a little flyer
5 called "Where To Eat Near the FTC Conference Center." I
6 noticed that the Where To Eat list is organized by price
7 bands and, so, if you wondered whether it's legitimate to
8 define a market by price bands, there's your answer.

9 So, without further ado, let me introduce the
10 FTC Chairman, Jon Leibowitz, to welcome you here.

1 **WELCOMING REMARKS BY CHAIRMAN JON LEIBOWITZ**

2 CHAIRMAN LEIBOWITZ: I love it when economists
3 make jokes to start off a meeting.

4 On behalf of Christine Varney and myself, let
5 me welcome you to our scheduled workshop on updating the
6 horizontal merger guidelines. When Christine and I
7 started talking about this during the summer, we thought
8 it was going to be a good time to think about updating
9 the guidelines. But timing is everything, and given the
10 announcement of Comcast/NBC Universal this morning, it's
11 a truly propitious time to start updating the guidelines.

12 Let me commend the FTC and DOJ team that's been
13 working to put this together. On the FTC side, that
14 would be Joe Farrell, who you're acquainted with, Rich
15 Feinstein and Howard Shelanski. And for the Justice
16 Department, that would be Molly Boast, Phil Weiser and
17 Carl Shapiro. By all accounts, this group has worked
18 together extremely well, which shouldn't be a great
19 surprise -- and I see Gene Kelman here, also an integral
20 part of any policy-related matter. And it shouldn't be a
21 surprise that they have worked really well together
22 because several of them have now worked for both agencies
23 and, also, because I think Phil lived in Howard's house
24 for a time and, of course, Carl and Joe are the virtual
25 Chang and Eng of the antitrust economist community.

1 We are really a far cry from the bad old days
2 of the Schering brief, the Section 2 Report, and ugly
3 clearance battles, I think stretching on for months.
4 It's really been the approach, I believe since Christine
5 and I started in our current jobs, to work together
6 collaboratively. I know it can be fun to talk about
7 conflict between the FTC and the Antitrust Division
8 rather than talking about our similarly held enforcement
9 priorities and policies, but the reality is we play
10 really, really well together, as this project
11 demonstrates.

12 Many of you know that I've been a critic of the
13 extent to which the Chicago School's -- and by the way,
14 I'm wearing my badge. I just wanted to show that. We
15 all have to wear our badges, particularly because the
16 magnetometer is broken outside, as all of you know.

17 Many of you know that I've been a critic of the
18 extent to which the Chicago School's optimism about
19 efficiencies and indifference towards oligopoly conduct
20 have affected merger reviews, as well as how it's
21 affected antitrust law generally. But from my
22 perspective, this effort isn't about giving any priority
23 to one antitrust school or another. It's really about
24 good government and making sure that the rules of the
25 road are clear and well understood, especially by those

1 who enforce them.

2 From my perspective, the current guidelines
3 have actually worked pretty well since the last update in
4 1992. And I know Jim Rill is right here and he deserves
5 enormous credit for being the leader of that 1992 update
6 -- What? You do. Don't be so self deprecating, you do.
7 Yet, I think they don't explain the process clearly
8 enough to businesses. They don't explain it clearly
9 enough to judges. Probably, if I had to be honest, I
10 would say that has helped us in some instances; it has
11 hurt us in others. And they don't incorporate the latest
12 economic thinking.

13 So, hopefully, by giving everyone a better idea
14 of how we look at mergers and also how they ought to be
15 examined by the Courts, we can clear up some
16 misconceptions and demystify the process. And if we can
17 do that, I think everybody wins, especially consumers who
18 benefit most from balanced, yet aggressive, antitrust
19 enforcement and businesses which, as you all know,
20 benefit enormously from certainty.

21 The reason why we need to update our guidelines
22 is pretty clear. Over the past 17 years, since the last
23 revision of the guidelines, merger analysis has developed
24 in important ways. But as our joint commentary noted
25 three years ago -- and where is -- is Tom Barnett here?

1 He's around here somewhere. Thank you. Tom Barnett and
2 Debbie Majoras were the leaders of that commentary.
3 Guidelines tend to exaggerate the extent to which the
4 agencies follow a single, rigid, step by step broad
5 approach to merger analysis, and we don't always follow
6 that approach when we evaluate mergers. Instead, we set
7 our inquiry on one key question, whether the merger under
8 review is really likely to lessen or substantially lessen
9 competition.

10 So, the areas we'll be thinking about stem from
11 that inquiry. And among them are, the use of direct
12 evidence of anti-competitive effects as an indication
13 that a merger may harm consumers, whether to clarify how
14 and why the agencies use the hypothetical monopolist test
15 to define markets, whether to update the description of
16 how the agencies use concentration statistics, like HHIs,
17 to understand the impact of the merger on the market --
18 you know, really, I think the question is really how much
19 should we increase the HHI thresholds in the guidelines
20 to better correspond to how we understand them -- and
21 whether to put remedies in the guidelines as other
22 antitrust jurisdictions have done. And, of course, I'm
23 going to keep an open mind, but I think all of these
24 ideas make a lot of sense.

25 Today, we're going to have four panels and a

1 veritable cavalcade of antitrust luminaries to help us
2 illuminate these issues. Among those speaking today are
3 Bob Pitofsky, Tim Muris, Jim Rill, Doug Melamed. Is Doug
4 here? Doug is not here. Well, we know why he's busy.
5 All right, that was an antitrust joke. I know it's early
6 in the morning. And Deb Garza and Tom Barnett who's back
7 there, too. And most of those people are just on the
8 first panel.

9 After their overview on the role of the
10 guidelines, we'll have specific panels on direct evidence
11 of competitive effects, market definition and unilateral
12 effects and, of course, this is just the start of the
13 project. We'll be taking our merger guidelines
14 examination on the road, holding workshops in New York
15 and Chicago next week and in Palo Alto next month, and
16 the final workshop will be back here in Washington, D.C.
17 at the end of January.

18 These workshops, of course, as you know, are
19 about transparency. But just as importantly, they're
20 about thinking through the merger review process with
21 very smart folks in the antitrust community outside of
22 our occasionally -- I would say often -- occasionally
23 insular, inside the inside of the Beltway/Justice
24 Department/FTC Antitrust axis. So, we really do look
25 forward to hearing from all of you, from incorporating

1 your ideas. You should feel free to challenge us as, of
2 course, my staff does on a minute-by-minute basis to me.

3 And with that, again, let me thank everyone for
4 coming today and let me turn it over to my very, very
5 good friend and colleague who is doing just a spectacular
6 job at the Antitrust Division, Christine Varney.

7 **(Applause.)**

1 **WELCOMING REMARKS BY CHRISTINE VARNEY**

2 MS. VARNEY: Thanks, Jon. Jon did a terrific
3 job laying out why we're all here today and what we're
4 doing in this undertaking and what we're going to be
5 doing today. So, before we turn to our first panel, let
6 me just add my thanks and my welcome.

7 I know I've gotten a lot of questions, as I'm
8 sure Jon has this morning, about the Comcast/NBC deal
9 that was announced this morning. So, let me share with
10 you what I shared with my staff, and that is, we're not
11 commenting on that today. But we're hopeful that this
12 kind of undertaking can help us understand the emerging
13 complex deals that we face, such as that one. So, good
14 morning, welcome and have a good day. Thank you.

1 first panel of the five workshops, the first of four
2 panels today.

3 And, so, particularly given the distinguished
4 group, this is an overview panel to really put the
5 guidelines in historical perspective, talk about their
6 role, their function and what types of things should be
7 in the guidelines and what things shouldn't be in the
8 guidelines, as well as, more specifically, where updating
9 and revisions might be most valuable and where they
10 should not be done. So to frame some of that.

11 We already indicated in our questions for
12 public comment, we see two general reasons why we're
13 undertaking this project at this time. One is to see if
14 a gap has developed between the guidelines as written and
15 actual practice, and good government would call for
16 closing that gap. And the other is the learning and
17 experiences developed in the intervening 17 or 18 years
18 that could be reflected. Those are not just joint
19 concepts, but they're overlapping interests here, and
20 we'll be addressing those on the panel.

21 In getting ready for this morning, I went back
22 and looked at the 1968 merger guidelines. I think we may
23 hear a little bit about them from some of our panelists.
24 We've got historical perspective. I can not resist
25 pointing out that the 1968 guidelines themselves are 17

1 pages in total and they cover horizontal, vertical and
2 conglomerate mergers; eight pages on the horizontal
3 mergers and they are very structuralist. And so, in a
4 market that is highly concentrated with the top four
5 firms having at least 75 percent of the market, if the
6 acquiring firm has a 10 percent and the acquired firm has
7 2 percent or more of the market, this would be ordinarily
8 challenged at the time and it goes from there.

9 We've come a long way and the question is what
10 the next step might be. One of the backdrops for this, I
11 think, is the decline of the structural presumption over
12 the decades and how that affects merger enforcement and
13 how it should be reflected in the guidelines.

14 I've asked each of the panelists to give some
15 introductory remarks for five to ten minutes a piece. I
16 will be tough and cut them off, their distinguished
17 nature notwithstanding. And I'd like to start with Bob
18 Pitofsky as one of the deans of the antitrust community.

19 Bob, please start, and all of you all have been
20 instructed to speak into the mic.

21 MR. PITOFSKY: Thank you, Carl. Good morning,
22 everybody.

23 I'm going to do two things. I am going to talk
24 about the historical role of the guidelines with respect
25 to American antitrust and then I'm going to talk a bit

1 about, if there is going to be another iteration, some of
2 the things that ought to be included, excluded,
3 clarified, amplified and so forth.

4 Let me start with the guidelines. In my view,
5 the guideline process, in many ways, has had the most
6 important influence on American antitrust policy in the
7 last 50 years. Now, you say, wait, wait, wait, there's
8 the Supreme Court, isn't there? And there's scholarship
9 and there's speeches and statements by the enforcement
10 people. Yeah. Wait, wait, wait, there's the Supreme
11 Court. What have they done? How many Supreme Court
12 antitrust cases did they take? The last horizontal
13 merger Supreme Court case was 35 years ago in General
14 Dynamics. It's not exactly an unimportant sector of the
15 economy, but the Court just isn't interested.

16 Academics are very powerful influences, but
17 they work their way into the guidelines. And, of course,
18 the enforcement people make speeches and statements and
19 bring cases, but it's a little hard to tell compared to
20 the guidelines what it is they have in mind and which way
21 they were going.

22 The first guidelines were issued in 1968 by the
23 Department of Justice. In those days, it was the style
24 of the Federal Trade Commission to sit out projects like
25 this and they sat this one out and did not join these

1 guidelines. Although later on, I think under Miles
2 Kirkpatrick, they joined the DOJ in later iterations of
3 the guidelines.

4 The dominant influence by far was Donald
5 Turner. Not only because he conceived of the concept of
6 guidelines, but he drew into those guidelines the
7 beginnings of sophisticated economic analysis and we have
8 progressed from there. It wasn't exactly a non-
9 controversial process. Don's view was enforcement people
10 had an obligation to tell the private sector what their
11 enforcement intentions were. I think that's right. I
12 thought it was right at the time. The problem is that a
13 lot of the lawyers at the DOJ said, what do you mean
14 you're going to give them a blueprint of what we think is
15 okay and what we think isn't? How are we going to win
16 any cases? All they'll do is wave the guidelines in
17 front of the judge and say, see, we followed the
18 guidelines.

19 It hasn't worked out that way. It hasn't
20 worked out that way at all. The Department of Justice
21 continues to win cases when it is forced to go to court.
22 The FTC, during my six and a half years, won 12 out of 14
23 cases when it was forced to go to court. So, Don stuck
24 to his guns and, in fact, the guidelines have survived.

25 Indeed, each iteration gets better and better.

1 Although, I will say two things about them. Each
2 iteration makes it somewhat more difficult for the
3 plaintiff, for the government, to win and, more
4 importantly, each iteration has far more sophisticated
5 economic analysis incorporated.

6 My dominant point today -- I hope I'll have
7 more than one or two chances to talk about it -- is the
8 following: An aim of the people who are revising these
9 guidelines is that they should incorporate, not
10 exclusively, but should incorporate the idea of making
11 these guidelines simpler, and clearer and, in some
12 particular areas, so as to give people a better idea of
13 what is intended. Simpler.

14 My example would be barriers to entry. It used
15 to run on about six or eight or nine pages in the
16 guidelines and introduced concepts like committed and
17 uncommitted entrants, sunk costs, viable minimum scale.
18 I mean, in a way, it's a brilliant piece of analysis.
19 And the lawyers in New York and the lawyers in
20 Washington, they get it, they're on board. But there are
21 a lot of lawyers and business people who find it very
22 difficult to know what minimum viable scale would be in a
23 year that hasn't happened yet.

24 What do I think ought to be introduced into the
25 guidelines that is not there now? Innovation markets.

1 It seems to me that as you look around the world, the
2 action has to do with innovation. The guidelines, from
3 the very beginning, have been preoccupied with price.
4 But price is not the only anti-competitive consequence of
5 various kinds of transactions. If two companies are both
6 working on the same improvement in a pharmaceutical or
7 widget or gadget or whatever they're working on and they
8 propose to merge, that could have a negative consumer
9 welfare consequence.

10 Now, the usual argument is, but you can't
11 measure market share in innovation markets. That's
12 fairly common reaction and it is very difficult. But I
13 think the answer is that you can. I want to know how
14 many patents these two companies obtained in the last
15 several years, how large is their staff, how qualified is
16 their staff, what kind of machinery do they have. Judge
17 Bork, among many others, has said, look, it is extremely
18 difficult, but it can be and it should be done. And
19 market shares can be measured in those areas.

20 A couple of final points, very briefly. I have
21 been writing for a long time and I'm very cranky about
22 the failing company defense. I think it's too stringent.
23 I think Congress didn't have in mind all those
24 qualifications before you could assert a failing company
25 defense and I don't even think it's good economics. But

1 we're going to talk about that on the panel later on, so
2 I'll hold my comments until a later point.

3 A few other changes, HHI, 100/1,800 and so
4 forth, is it really only a safe harbor if you're under
5 1,000? Nobody's brought a case -- actually, we brought
6 two cases. I can't say nobody. But both oil companies,
7 they were marketers and they were in around the 1,500,
8 1,600 range. But that's once in a blue moon. And if, in
9 fact, government's intention is not to bring cases unless
10 the HHI is over 2,000 or 2,500, we ought to say so.

11 Many people think the SSNIP test is 5 percent,
12 and maybe it is. Many other people would say it's 10
13 percent and everybody in the know knows it. Maybe that's
14 true. I don't know it one way or the other. What I do
15 think is it ought to be clearly stated in the guidelines
16 as to what the SSNIP test is and if it's changed. It
17 ought to be changed, as Don Turner would put it, to tell
18 people what the enforcement intentions are of the
19 enforcement agencies.

20 And, finally, this is just a pet peeve on my
21 part, but I'm sure all of you recognize that even though
22 trend to concentration was the principal concern of
23 Congress when they amended the Celler-Kefauver Act in
24 1950, the principal concern, trend to concentration has
25 never been regarded as a factor in deciding whether or

1 not there had been or will be anti-competitive effects.
2 All I ask is that the people who are working on revising
3 the guidelines take a look at that and see if it belongs
4 in the next version of the guidelines. Thank you.

5 MR. SHAPIRO: Thanks, Bob. Next, I'd like to
6 ask Jim Rill to speak to us. Jim was Assistant Attorney
7 General when the current guidelines in chief were drafted
8 in '92. I think he has great insights about that process
9 and the results and how they've held up.

10 Jim?

11 MR. RILL: Thanks very much, Carl. It's really
12 an honor to be here with such a guest panel and it's rare
13 that I am not the oldest person on the panel. I'll give
14 that honor to Bob Pitofsky.

15 Let's take a look at what guidelines are
16 supposed to do and at the '92 guidelines themselves. I
17 think, they set forth an explication which makes a lot of
18 sense. The guidelines -- quoting now from the
19 guidelines, "The guidelines have the dual purpose of
20 leading to appropriate enforcement decisions on
21 horizontal mergers and providing the bar and the business
22 community with reasonably clear guidance with which to
23 access to antitrust enforcement risks of proposed
24 transactions."

25 Good so far as it goes. There's another

1 player, though, that's not mentioned in that statement
2 and another player which I think is of importance in
3 considering revision of the guidelines and, in fact, has
4 played a major role in the revision of the guidelines
5 that took place in 1982 and again in 1992 and again, I
6 think, in 1997, and that is, of course, the Courts.

7 So, the guidelines have an intellectual -- an
8 analytical path, hopefully an intellectual path, too, but
9 an analytical path, but it's not a cookbook. The
10 guidelines are not a cookbook. They're not a nice,
11 articulate, well defined recipe to follow in designing
12 every aspect of merger enforcement, but rather a broad,
13 but clear, analytical path. I have a personal vendetta
14 against anyone who talks to me about something called a
15 guideline violation. I submit there is no such thing as
16 a guideline violation.

17 So, how does one achieve those purposes? It
18 seems to me there are three principles, and I owe this
19 thought to an interesting paper that was prepared by Tim
20 Muris in New Institutional Economics. Any principle, and
21 I think this applies to guidelines -- needs to be: one,
22 based on sound law and economics; two, and of great
23 importance, needs to be readily understandable and
24 practical by counsel, by firms and by courts; and three,
25 needs to be sufficiently flexible to adapt to new

1 learning in law and economics. Those three principles
2 should, I submit, guide the process that's going on right
3 now.

4 I endorse the process that's going on right
5 now. It's been 17 years since the 1992 guidelines. The
6 1992 guidelines were 10 years after the 1982 guidelines,
7 which were 14 years after the 1968 guidelines. I have
8 just given you my total knowledge of econometrics.

9 I agree with Bob that the Turner guidelines
10 were revolutionary in 1968, not only because of the
11 infusion of some economic learning into the guidelines,
12 but the Assistant Attorney General had the fortitude to
13 do that which I would never have done. He told the
14 Supreme Court of the United States that it was full of
15 baloney and that he certainly wouldn't bring cases that
16 would fit under the rubric of the Vonns case or the Papst
17 Blatz case. If you look at the Turner guidelines, the
18 guideline levels are well above the learning of those two
19 cases.

20 But the Turner guidelines went so far as they
21 went. And by 1982, economic learning and court
22 decisions, particularly General Dynamics, had begun to
23 expose the error of reliance on rigid market or tests.
24 Thus, the Baxter guidelines undertook to raise the
25 thresholds and identify factors such as entry, in

1 particular, that went beyond market shares.

2 The 1982 guidelines were a massive step
3 forward, I think a sea change, a seismic change in
4 antitrust, and for that reason, I think Bill Baxter was
5 one of the truly great Assistant Attorneys General to
6 serve in that post. But, they remain largely structural
7 and the flawed market share paradigm was put in terms of
8 likelihood of challenge, which I think went much too far.

9 A second problem with the 1982 guidelines is
10 that they were only as -- with the '68 guidelines, only
11 Justice Department guidelines. And when the 1982
12 guidelines came out, the Federal Trade Commission,
13 several days later, put out a very general statement that
14 they weren't necessarily following the '82 guidelines but
15 were going to look at the law and facts of each case.

16 During the next decade, court decisions and
17 economic literature put further doubt in the structural
18 approach, even of the '82 guidelines, and we had cases
19 like Baker Hughes which called into serious question the
20 market share paradigm and dwelt, to a great extent, on
21 entry.

22 At the same time, the entry issue was being
23 rather superficially handled when you look at cases like
24 waste management in the Second Circuit where entry was
25 sophisticatedly analyzed on the basis, well, it must be

1 cheap to buy a trash truck. Entry, obviously, was not
2 properly being defined either in the guidelines or
3 certainly by the courts, and the Calder decision a year
4 later was to the same effect, not with trash trucks, but
5 hose nozzles.

6 Advanced economic thinking, moreover -- my
7 particular favorite is Bobby Willig's article in
8 Brookings, produced a reliance on unilateral effects
9 analysis which had not been incorporated in the '82
10 guidelines, particularly in the area of differentiated
11 products. The '92 guidelines in that area were somewhat
12 actually anticipated in enforcement decisions, such as
13 the Procter and Gamble/Rorer case, finding within a broad
14 stomach remedy market, unilateral effects by the
15 acquisition of Maalox by Pepto Bismol.

16 Thus, there was a need to accommodate new
17 learning and replace some of the gaps, to use Carl's
18 term, that existed in the guidelines versus the courts
19 and economic learning.

20 In the '92 guidelines, the notion of a
21 presumption on the market share paradigm replaced the
22 notion of a likelihood of challenge. The competitive
23 effects provisions of the guidelines were greatly
24 expanded into a separate and rather long section. There
25 was a much more comprehensive approach to entry and, as

1 Bob indicated, a somewhat intricate approach to entry.
2 There was, I think, most importantly, the infusion of the
3 notion of unilateral effects, particularly in
4 differentiated markets, but also in commodity markets,
5 apart from the analysis of coordinated effects. And,
6 yes, they were the first ever joint guidelines issued by
7 the Federal Trade Commission as well as the Department of
8 Justice. And there are stories there I could tell you,
9 but won't in this panel.

10 So, let's go back to the desirability of
11 revision now. Is there new learning to be reflected?
12 Yes. Certainly, with respect to the market share
13 paradigm and presumptions. Do we accurately explain in
14 the guidelines what the agencies are doing now? No. If
15 one looks at the FTC's reports on when challenges are
16 made and in what particular industry, at what market
17 share level, at what level of customer complaints and
18 other factors, they bear little relationship to the
19 1,800/100 formula that's set forth in the guidelines,
20 even as a presumption.

21 Is the presumption right or is simply the
22 market share paradigm a trigger to further analysis,
23 which it seems to be in many of the court decisions? And
24 we need to wonder whether the guidelines currently
25 provide an explanation of what the agencies are doing and

1 what the courts are doing in a concise and understandable
2 manner. There I go to the issue of unilateral effects,
3 which I think does cry out for further explanation, but
4 not necessarily radical change.

5 I think that we want to keep the -- I would
6 urge the drafters to keep the market definition and
7 hypothetical monopolist tests. These are tests that have
8 stood the weather-beating winds of time. They have
9 widely been adopted by the courts, and I could cite all
10 the cases from Swedish Match to Oracle as a starting
11 paradigm. The question is, does it have to be a starting
12 paradigm or can there be a holistic approach? I think a
13 holistic approach is fine if it doesn't become mush. But
14 Oracle, Country Lakes Food, Sunguard, Swedish Match, all
15 of these cases adopt the market definition paradigm and
16 it seems to me that's appropriate.

17 The courts raised question of the HHI levels,
18 in fact, in the Arch Coal decision. The District Court
19 not only looked at the guidelines, but then looked at the
20 FTC report which indicated the FTC, itself, doesn't
21 follow the rigid principles of the guidelines. I think
22 one reads Oracle and would have to say that the arguments
23 or the positions taken by Judge Vaughn Walker, in that
24 case, illuminate some of the areas where unilateral
25 effects can be addressed in guideline form. But I would

1 urge the drafters not to, even in the unilateral effects
2 differentiated product area, to abandon the market
3 definition principle.

4 Bob mentioned the SSNIP test. I agree with
5 him. I think there needs to be an explanation of when a
6 5 percent SSNIP test is deviated from and then what
7 reasons and why, because it's not spelled out in the
8 guidelines, but it happens. If you look at the paper we
9 submitted, it happens a lot in energy and in the retail
10 food industry.

11 Finally, I think the power buyer point needs to
12 be looked at, if there is such a principle to be
13 considered. It came up in not only Country Lake Foods,
14 but also in the ADM Synthetic Sweetener business.

15 So, after 17 years, this adolescent, I think,
16 is ready to grow into somewhat more maturity. I would
17 say radical change is not appropriate. Some commentary
18 is quite probably appropriate, but I don't think a
19 treatise is appropriate because if you start writing a
20 treatise, you get into big formulas, and you lose both
21 comprehensibility and flexibility.

22 Overall, I think the project is timely,
23 excellent and certainly led by competent people who
24 should be leading a project of this sort and, again, I'm
25 honored to be able to participate. Thanks, Carl and Joe.

1 MR. SHAPIRO: Thank you so much, Jim. That's
2 very gracious. We're going to return to some of these
3 questions you've posed in the discussion for sure.

4 Next, I'd like to ask Doug Melamed to speak.
5 Doug was Deputy Assistant Attorney General and Acting
6 Assistant Attorney General in the Antitrust Division in
7 the late nineties and I'm sure will put that hat on and
8 not his new hat as Intel's General Counsel as he speaks.

9 MR. MELAMED: I'm always thinking of the public
10 interest, Carl, and the happy news is that the interests
11 of Intel and the interests of the public are always
12 aligned.

13 **(Laughter).**

14 MR. MELAMED: So, there's no tension there.

15 Let me just say at the outset I think
16 guidelines in the merger area are especially important
17 because, unlike the Sherman Act where 99 percent of the
18 law and the guidance that is given to the business
19 community arises out of the case law, sort of the common
20 law process, in the merger context, it's largely a
21 regulatory process. Obviously, one constrained by the
22 case law and one in which the case law is influenced by
23 the regulatory actions. But it is largely a regulatory
24 process in terms of its most immediate and significant
25 impact on the business community.

1 And, so, it's critical that the regulators -- I
2 don't like that word, but it's not about shorthand --
3 articulate with as much clarity as possible the way that
4 they think, and they think the private parties and courts
5 ought to think, about mergers. So, I think guidelines
6 are important. And, that being the case, I think after
7 17 years, it is very desirable to bring them up to date
8 to reflect contemporary learning.

9 In the introductory comments, I want to make
10 two points, one a broad one and one a narrow one. The
11 broad one is this. I actually haven't read the
12 guidelines for a long time or hadn't until a couple days
13 ago when I read them in anticipation of this panel. I
14 guess maybe I had gone back to look for little passages
15 to cite in briefs or something, but not really looked at
16 them in any comprehensive way.

17 Rereading them, I was struck by how formalistic
18 they are. They have all sorts of definitions and
19 categories of abstractions, committed versus uncommitted
20 entry, the definition of a market, notion of HHIs, and
21 most importantly, the five-step analysis -- which
22 although there's some lip service paid to, well, this is
23 only an aid in answering the question of competitive
24 effects -- is really presented almost as a decision tree
25 kind of process.

1 Now, the various analytical tools that are
2 described in the guidelines, whether they're the SSNIP
3 test or diversion ratios or minimum viable scale and so
4 forth, are important analytical tools, and I think it
5 would be very valuable for the agencies to update the
6 description of those tools and how they are used to
7 reflect current practice and current economic thinking.

8 But they're not ends in themselves. This isn't
9 kind of an exercise -- merger review is not an exercise
10 of applying these various analytical tools. They are
11 simply tools, means of shedding light on the ultimate
12 question, which is whether the contemplated merger is
13 going to injure competition and disadvantage some segment
14 of the community that we want to protect.

15 So, I think while the analytical tools of the
16 sort described in the guidelines are very valuable, I
17 don't think the guidelines actually describe, taken as a
18 whole, the process that practitioners of the agencies
19 actually go through in reviewing a merger. And I think
20 in that respect they are somewhat -- I don't want to say
21 misleading because I think at least the regular
22 practitioners know that, but they ought to be updated, I
23 think, starting from perhaps that preface.

24 Roughly speaking, here's what I do, and I think
25 a lot of people do something like this, in analyzing a

1 horizontal merger. You have companies A and B. You
2 represent A and if you're in practice or if you're in the
3 agency, you're looking at contemplated merger. And so
4 you say, okay, do A and B compete? And if so, where?
5 Who are the consumers or the suppliers if you're
6 concerned about buy side markets? For whose patronage do
7 they compete? And then you ask, well, who else do they
8 compete with? Who else constrains their behavior vis-a-
9 vis those trading partners?

10 And then you ask, okay, if we eliminate rivalry
11 between A and B, what's going to happen? Are there going
12 to be other extant competitors to constrain it? Is it
13 likely that people on the fringes will enter or readjust
14 their competitive behavior? Are these rivals close
15 substitutes for one another or are they not so close?
16 You know, are we dealing with homogeneous products? Do
17 we have concerns about coordinated effects? Are we
18 dealing with a unilateral effects story?

19 But the analysis starts, at least to my likes,
20 by asking who are the merging parties, where do they
21 compete, what's the affected area of commerce and now how
22 do I analyze the question, or answer the question, what
23 happens if we eliminate rivalry between these two merging
24 parties?

25 In the course of thinking of it, building up

1 from the facts that way, at various times, one might
2 think, gee, there are certain analytical tools that might
3 be helpful here. It might be helpful to know what is the
4 market. It might be helpful to know whether there are
5 likely entrants. And I don't know committed, non-
6 committed, I don't think that's part of most people's
7 active vocabulary. But you do ask how likely is it that
8 they're going to enter. And you look at the factors that
9 go into that dichotomy and the guidelines and so forth.

10 The problem, I think, with starting sort of
11 from the abstractions and working down is that, it not
12 only doesn't describe I think what, in fact, happens,
13 which reflects that it's a problem, but that it can lead
14 to some erroneous conclusions. For example, firms
15 outside the market can be important constraints on
16 behavior of firms in the market. If you imagine, for
17 example, a monopolist merging with the closest, albeit
18 distant, substitute who's outside the market, you might
19 be very concerned about the competitive impact of losing
20 the constraint of that outside the market, closest
21 substitute. If you focus just on the market and the
22 HHIs, you know, you're obviously going to lose sight of
23 that.

24 Committed, uncommitted is really a matter of
25 degree. I think the dichotomy doesn't make a lot of

1 sense. Market shares matter sometimes and sometimes more
2 than others. And, of course, the problem with market
3 shares is that we don't really care about historical
4 market shares, we only care about future market shares.
5 And, so, we might want to say -- if we want to make a
6 prediction, what will the market shares be in some
7 relevant time horizon, we might start with historical
8 market shares on a kind of past is prologue notion, but
9 always asking the question, is this a prologue or do we
10 have a General Dynamics kind of situation here?

11 One big suggestion is that I'd like to see the
12 guidelines focus more on how one actually builds up a
13 competitive analysis starting from the facts, how one
14 uses the analytical tools that are presently in the
15 guidelines and I assume will be enriched by this
16 revision, rather than by coming up with a nice conceptual
17 framework of how one might employ all these tools in some
18 stylized merger analysis.

19 The second and narrower suggestion I would have
20 has to do with efficiencies. Efficiencies are really
21 important, obviously. Innovation is really important.
22 All the studies we all know show that innovation
23 contributes a great deal more to economic welfare than
24 avoiding dead weight loss and so forth. So, we really
25 have to keep an eye on efficiencies.

1 Now, I understand probably a fraction as much
2 as others in this room, but to some extent at least,
3 efficiencies are commonly over-predicted in mergers not
4 just for agency consumption but probably for Board of
5 Director consumption and we have all the studies about
6 mergers that fail and so forth. But it is still very
7 important, it seems to me, that the agencies and the
8 practitioners and, ultimately, the courts have a clear
9 idea of how to think about efficiencies, how to assess
10 them recognizing the uncertainty of prediction, and then
11 how to evaluate them, how to compare them against what
12 might look like games of market power by the merging
13 firms.

14 I'm particularly interested in an issue that
15 was treated in the '97 update as a footnote item and I
16 think is really a very important question that I don't
17 know the answer to. I don't know what the agencies or
18 the courts would say in response to this question. What
19 do you do if you have significant efficiencies in market
20 -- I'll use that term -- market A and what apparently
21 looks like a moderate and competitive concern in market
22 B? A lot of people I think would say, well, the courts
23 are clear, you can't weigh the benefits in market A
24 against the harms in market B, that's an anti-competitive
25 transaction. I don't think that would be the right

1 policy result and I would hope the new guidelines would
2 explicitly grapple with that issue and give us some
3 guidance as to how that comparison, that trade-off could
4 be handled.

5 MR. SHAPIRO: Thank you, Doug. Again, lots of
6 food for thought later. A number of people have brought
7 up innovation and I think it's something we really want
8 to return to. There's not much on the guidelines on
9 that. So, everybody put your thinking caps on.

10 Next, I'd like to ask Tim Muris to speak. Tim
11 has experience going back to the eighties in the time of
12 the '82 guidelines and, more recently, of course,
13 Chairman of the Federal Trade Commission. So, Tim, tell
14 us.

15 MR. MURIS: Thank you, Carl. It's a pleasure
16 to be here at old timer's day, except for Carl who's a
17 recidivist, I guess, as others of us are.

18 Let me try to discuss three principles for
19 revising the guidelines. To begin, the guidelines have
20 succeeded in significant part because they do not try to
21 do too much. Rather than complex, lengthy regulations,
22 they provide a flexible and durable framework that
23 reflects the antitrust community's consensus. This focus
24 on consensus should underlie any potential changes to the
25 guidelines.

1 The lack of such consensus doomed the recent
2 attempt to provide a one-size-fits-all test for analyzing
3 unilateral conduct under Section 2. The long-held
4 consensus regarding the relative insignificance of simple
5 concentration tests, which we've heard about already,
6 justifies reflection of that view in any revisions to the
7 current guidelines. Major changes that lack such
8 consensus, however, risk the fate of last year's Section
9 2 report.

10 My second point is that the guidelines should
11 reflect agency practice. When I was Chairman, I pushed
12 this in two ways, the data release, which I'll discuss
13 momentarily, and the merger commentary, which we began as
14 well. In terms of practice, the agency should adjust the
15 HHI thresholds and no longer characterize certain mergers
16 as presumptively anti-competitive. Jim Rill's 1992
17 revision stated that the numbers are only the starting
18 point, and I agree with that.

19 Nevertheless, the numbers can provide useful
20 screens, and let me suggest three. First, when there's a
21 post-merger HHI below 1,800, there's unlikely to be
22 competitive concerns. It sounds like Bob had an idea of
23 2,000, but I'll talk about the data release in more
24 detail in a second.

25 Second, post-merger HHIs between 1,800 and

1 2,400 are unlikely to have adverse competitive effects
2 when the delta is below 300. Mergers in this tier with a
3 delta of 300 or more are likely to require detailed
4 investigation into their likely competitive effects.
5 And, third, post-merger HHIs of 2,400 or greater are
6 unlikely to have adverse competitive effects when the
7 delta is below 150. Mergers in this tier with deltas
8 above 150 or more require detailed investigation into
9 their likely competitive effects.

10 Now, these numbers don't come from any theory,
11 these numbers, I believe, come from the agency's data
12 releases. Now, because the data releases were in ranges,
13 it's possible -- and the agencies have the actual numbers
14 in hand -- it's possible that these numbers aren't
15 precisely correct and there should be some adjustments.
16 But I do believe that the experience would provide a very
17 useful screen and the numbers reflect hundreds of merger
18 investigations. Indeed, because the merger wave occurred
19 in the late nineties, most of the numbers are still from
20 the Clinton Administration.

21 Another topic on which the guidelines and
22 practice diverge involves fixed cost. I think the
23 commentary makes it clear that fixed costs count, under
24 certain circumstances, and any revisions should reflect
25 that.

1 Moreover, the guidelines should confirm that
2 the burden on the parties to demonstrate efficiencies is
3 no greater than the agency's burden to show anti-
4 competitive effects. Now, my experience is that agency
5 leaders accept the statement that I just made, although
6 there are some on the staff that I don't think agree. If
7 agency practice is to apply different burdens, then I
8 think any revisions should justify such an extraordinary
9 position.

10 My third and final point is that evaluation of
11 individual mergers is heavily fact specific and that,
12 therefore, any changes to the guidelines should highlight
13 those facts that are particularly probative. And let me
14 suggest five examples.

15 The first is that the best evidence for
16 determining efficiencies involves actual experience.
17 Just as the agencies rightly dismiss unsubstantiated
18 claims, they should accept as presumptively valid, those
19 claims based on the best possible evidence, which is the
20 resulting efficiencies or lack thereof in recent mergers
21 involving one of the merging companies or others in a
22 relevant industry. And, of course, such evidence can
23 include improvements in product quality, not just
24 reductions in cost.

25 Second, the guidelines should not assume the

1 form of competition among firms offering differentiated
2 products. Any revision to the guidelines that assumes a
3 certain form of competition, for example, that firms
4 compete by simply setting price, would make it more
5 difficult for the guidelines to characterize existing
6 competition accurately and to predict any loss of
7 competition following a merger.

8 The guidelines' framework searches for ways in
9 which market power may be exercised successfully and that
10 analysis depends heavily on the particular industry
11 setting and the form the competition takes. Specifying
12 the form of competition, independent of the industry
13 particulars, risks serious error.

14 And I associate here myself with an article by
15 Werden, Froeb and Scheffman, who noted that after 15
16 years of using various models, we all have a greater
17 appreciation on the complexity and variety of competitive
18 processes and clearer understanding that differing
19 modeling assumptions can amplify or attenuate merger
20 price increases. As the guidelines move away from
21 structural presumptions, they should not incorporate
22 models that do not reflect real world competition.

23 The third highly probative fact any revision
24 should recognize is that merging firms have an incentive
25 to pass on marginal cost savings, regardless of the

1 number of remaining competitors, which is a proposition
2 that simply follows from the fact that almost everyone
3 faces a downward sloping demand curve.

4 Fourth, the guidelines should reflect the
5 importance of customer views in determining the
6 likelihood of anti-competitive effects. The data release
7 showed that strong, consistent complaints almost always
8 lead to a challenge. In my experience, I think most
9 people's experience is that when you've got strong,
10 consistent support, the agencies will not challenge.

11 Unfortunately, in Heinz, Arch Coal and Oracle,
12 Courts were dismissive of customer opinions. In
13 assessing customer testimony, the Courts and the agencies
14 should recognize the policy judgment that underlies the
15 business judgment rule so prominent in corporate law.
16 This rule essentially requires judicial abstention from
17 second guessing corporate decisions based in part on the
18 relative experience of businesses versus judges and
19 courts. The business judgment rule creates the
20 presumption that corporate directors and officers act on
21 an informed basis, in good faith, and in the best
22 interests of the corporation.

23 This rationale applies to customer testimony.
24 Once the agencies or courts have screened customers to
25 ensure their testimony is reasonably informed, in good

1 faith and not based on conflicting or anti-competitive
2 incentives, the decision makers should give great weight
3 to customers' views on mergers likely effects. Customers
4 will most directly experience the effects of a merger.
5 Their self-interest, combined with their knowledge of the
6 industry, ensures that their views will provide crucial
7 evidence.

8 Most antitrust lawyers, on both sides of the
9 table, agree that customers remain the most objective
10 marketplace participants. The decisions they make
11 frequently provide a better window on how the merger
12 actually functions than an economist's model or the
13 court's intuition.

14 Finally, my final probative fact involves the
15 importance of post-merger evidence in consummated
16 mergers. Here the agencies have something fundamentally
17 different than typically is the case in the normal HSR
18 process -- or they can have it anyway -- that's evidence
19 of the merger's actual competitive impact. When reliable
20 evidence of that impact is available, it should trump the
21 predictive analysis used in the standard HSR process.
22 The relevant analogy is to judicial decisions regarding
23 the superiority of direct evidence of competitive impact
24 in Section 1 decisions.

25 Now, of course, the post-merger evidence has to

1 be reliable and the agencies have to be confident that
2 their measurements are accurate and merger-specific. In
3 at least two instances, reliable measurements of the
4 merger's impact will likely be impossible. The first
5 involves cases in which too little time has passed post-
6 merger to measure the effect. I think Chicago Bridge was
7 a good example of that. And the second occurs when the
8 merging parties have manipulated the post-acquisition
9 evidence.

10 Thank you and I look forward to our discussion.

11 MR. SHAPIRO: Okay, thank you very much, Tim.

12 Our last speaker, Deb Garza, like Doug, was a
13 Deputy Assistant Attorney General and then Acting
14 Assistant Attorney General in the Antitrust Division, a
15 bit more recently. Deb, please go ahead.

16 MS. GARZA: Thank you. It really is an honor
17 to join this panel of colleagues, each of whom has
18 contributed significantly to antitrust scholarship and
19 the development of competition policy, both within and
20 outside the United States. Jim, particularly, with
21 respect to the ICN, which you're responsible for.

22 My comments today will draw largely on the work
23 of the Antitrust Modernization Commission, as well as on
24 my experience in both private practice and in government,
25 using the merger guidelines, explaining them to clients,

1 merging parties and persons affected by mergers. I've
2 also had a bit of experience working on guidelines,
3 including the 1984 revisions to the 1982 Justice
4 Department merger guidelines. So, I'm very sympathetic
5 to the challenges that the agencies are facing.

6 I'm also very sympathetic to the notion of why
7 it's an important thing to be engaged in review and
8 potential revision of the guidelines. The guidelines
9 serve several important purposes. Educating the public
10 about the goals and substance of competition policy is
11 one. Ensuring the transparency and fairness of
12 enforcement is another. Providing certainty that is
13 needed for the free flow of capital in well functioning
14 markets, facilitating voluntary compliance with the law
15 and sometimes also advancing the development of the law
16 in the courts.

17 I think the '68 guidelines, the '82, the '84,
18 all the subsequent guideline revisions have actually done
19 a remarkable job of helping to forge the development of
20 merger law in the United States and abroad. On the other
21 hand, and we may discuss this later, I don't think it
22 should be the primary purpose of the guidelines to try to
23 advance the law.

24 I also think that even the process of
25 developing, reviewing and updating guidelines serves a

1 very important purpose of fostering dialogue and
2 understanding, forcing the agencies to examine the
3 efficacy of current policy and their articulation of that
4 policy and ensuring that enforcement policy remains
5 valid. Even if no significant changes are made to the
6 guidelines, there is a real value, I think, to confirming
7 the consensus support for them.

8 Of course, it's important to ensure that the
9 guidelines remain current, that they accurately reflect
10 both the agencies' actual enforcement policy and
11 practices and recent developments in the law. A material
12 gap between what the guidelines say and what the agencies
13 do actually could undermine public confidence and
14 legitimacy of government enforcement.

15 I want to quickly go to the AMC
16 recommendations, and I note, too, going last gives me the
17 opportunity to see that, just as at the AMC, there was a
18 substantial amount of bipartisan consensus about a number
19 of things I think that I've seen developing up here
20 already, while there are some differences, some
21 substantial consensus on a number of matters.

22 Let me go quickly through the AMC
23 recommendations that I think are relevant to the current
24 exercise for those of you who don't carry the AMC report
25 around with you.

1 UNIDENTIFIED MALE: It's big.

2 MS. GARZA: It is big, yeah. I should get a
3 nice little abridged version of it.

4 First, the AMC concludes that there was a
5 general consensus that the basic framework for analyzing
6 mergers followed by the U.S. enforcement agencies and
7 courts is sound, and I think that's an important starting
8 point.

9 Second, the AMC concluded that no major changes
10 to merger enforcement policy are needed to address issues
11 in industries characterized by technological change and
12 innovation because current law, including the merger
13 guidelines, are sufficiently flexible to address those
14 aspects of competition. At the same time, the AMC did
15 make several recommendations specifically related to the
16 review of innovation-related aspects of mergers.

17 The AMC recommended that the merger guidelines
18 should be updated to explain more extensively how the
19 agencies evaluate the potential impact of a merger on
20 innovation. The ability to innovate is a significant
21 reason for some mergers and innovation is extremely
22 important to economic welfare, yet the current guidelines
23 mention innovation only in passing in footnote six, which
24 they said sellers with market power also may lessen
25 competition on dimensions other than price, such as

1 product, quality, service and innovation.

2 The Commission recognized that there remains a
3 need for additional learning regarding innovation
4 competition, but concluded that the agencies have
5 sufficiently considered the issues involved to provide
6 some more useful guidance than what we see in that
7 footnote.

8 Next, the AMC recommended that the merger
9 guidelines should be updated to include an explanation of
10 how the agencies evaluate non-horizontal mergers. Now, I
11 realize that this exercise is specifically designed to
12 think about the horizontal merger guidelines, but let me
13 tilt at some windmills here and represent the AMC by
14 suggesting that it would be very worthwhile for the
15 agencies to revisit their treatment and articulation of
16 their treatment by vertical guidelines.

17 The '82 and '84 merger guidelines, which were
18 only the DOJ, contained a section addressing non-
19 horizontal mergers, including vertical mergers and
20 mergers raising potential competition concerns. Although
21 that section of the '82 and '84 guidelines addressing
22 non-horizontal mergers was never formally abandoned, the
23 '92 merger guidelines and the '97 revisions did not
24 include that section and the FTC has never, to my
25 knowledge, issued any sort of guidelines or statements

1 about their treatment of vertical mergers.

2 Although significant thinking has occurred
3 regarding vertical mergers since 1984, the guidelines
4 haven't been updated. The AMC concluded that the
5 horizontal merger guidelines have brought significant
6 transparency on how the agencies evaluate horizontal
7 mergers. The business community has benefitted,
8 petitioners have benefitted and we think they would
9 benefit greatly from some updated articulation of the
10 competitive effects of vertical mergers.

11 I'll note that Chairman Leibowitz mentioned
12 today the Comcast/NBC Universal merger, which I don't
13 know, but I suspect may have some vertical aspects to it.
14 Just another illustration, the agencies do look at
15 vertical aspects of transactions in important
16 transactions and it seems to me a real mess not to do
17 something to address the fact that the last time that
18 they spoke to this issue was in 1982.

19 The AMC recommended that the agencies should
20 increase the weight given to fixed cost efficiencies,
21 such as research and development expenses in dynamic
22 innovation-driven industries where marginal costs are low
23 relative to typical prices. The current merger
24 guidelines appears to weigh most heavily efficiencies
25 that will reduce price to consumers in the short run.

1 Reductions in total costs, including fixed costs, such as
2 improving upon the rate and quality of innovation, have
3 less, if any, effect on pricing in the short run,
4 obviously. In the longer run, however, some, if not all,
5 such efficiencies could also likely benefit consumers in
6 the form of lower prices, increased choice and improved
7 quality.

8 Although the current merger guidelines do
9 recognize that R&D efficiencies should be considered,
10 they appear to treat them with particular skepticism.
11 While the AMC recognized the difficulty of measuring
12 efficiencies and balancing the value of future benefits
13 that may result from innovation against the current costs
14 to consumers, given the importance of innovation and the
15 centrality of innovation-based industries to our current
16 economy, the Commission urged the agencies to, in effect,
17 give the highest priority to the appropriate treatment
18 and articulation of how it looks at innovation issues in
19 merger analysis.

20 The AMC recommended that the agencies should
21 give substantial weight to demonstrating that a merger
22 will enhance consumer welfare by enabling the companies
23 to increase innovation, recommended that that agency
24 should be flexible in adjusting the two-year time horizon
25 for entry where appropriate to account for innovation

1 that may change competitive conditions. The Commission
2 expressed concern that the current merger guidelines do
3 not clearly acknowledge the possibility of dynamic change
4 over a longer period of time than two years.

5 Innovation may result in entry beyond the two-
6 year time horizon. While we recognize that the
7 guidelines do not purport to present a hard and fast
8 rule, the Commission recommended that the agencies
9 increase their flexibility in this regard to ensure that
10 innovation that will change competitive conditions more
11 than two years out receive the proper consideration.

12 And, finally, the AMC recommended further study
13 of merger policies. Specifically, the Commission
14 recommended that the agencies seek to heighten
15 understanding of the basis for U.S. merger enforcement
16 policy, including through study of the relationship
17 between concentration and other market characteristics
18 and market performance to provide a better basis for
19 assessing the efficacy of current merger policy. Thank
20 you.

21 MR. SHAPIRO: Well, thank you very much, Deb.

22 Before we turn to discussion, I wanted to have
23 a brief advertisement for our next panel. So, a word
24 from our sponsor. We're particularly fortunate to have
25 Judge Doug Ginsburg here on the next panel. We're very

1 honored that he accepted our invitation to come and
2 speak. So, stay tuned for that.

3 Now, back to our regularly scheduled
4 programming. I have a number of questions and I want to
5 kind of move it along, and I'll look for each of you to
6 indicate when you want to weigh in here.

7 The innovation topic, almost every one of you
8 has mentioned it, okay? So, let's stipulate that
9 innovation is really important. Let's even stipulate
10 it's more important than small price changes, okay? The
11 AMC says that we should factor that more in. There's
12 virtually nothing in the guidelines on innovation
13 effects.

14 How might we do that while maintaining
15 flexibility and while recognizing that it may be very
16 hard for the agencies to peer into the future far enough
17 to really discern innovation effects? What kind of
18 markers could we look to if we want to add some material
19 on that in the guidelines?

20 Tim, I know you're interested in this topic.

21 MR. MURIS: Sure. I think you should give more
22 guidance. I'm not sure you're ready to do guidelines.
23 There are three particular issues that make this
24 particularly difficult. One is the economics doesn't
25 point in any uniform way. We know, I think with great

1 confidence, and the statistics show this, that mergers to
2 monopoly and mergers to duopoly normally are bad and
3 should be challenged.

4 The economic models and limited evidence on the
5 innovation point -- and some of the best summary is still
6 in a report Bob did in that first set of hearings that he
7 had. About the best that you can say is that in so-
8 called mergers to monopoly situations, sometimes it's
9 anti-competitive, but not always. So, you've got a
10 fundamentally different meaning of numbers than you have
11 in product market cases. That's the first problem.

12 The second problem is the benefits from
13 successful innovation, in many cases, are just
14 overwhelming. Take the drug situation. We did the
15 Genzyme case. It was one of the few cases when I was
16 Chairman that was controversial and we allowed what was a
17 two-to-one merger to go through, and they succeeded in a
18 drug to deal with a horrible disease called Pompe's
19 Disease. Those kind of benefits, you know, dwarf the
20 benefits in the typical product merger of, you know, 5 to
21 7 percent lower cost. And that's more true generally
22 with innovation, I think people believe.

23 The third problem is our experience -- I still
24 say our, I guess I can't get over that -- the experience
25 of being the government when the analysis of innovation

1 is mostly at the FTC and mostly with drug mergers.
2 There's nothing wrong with that, but they have -- there's
3 a particular regulatory process that makes the whole
4 innovation issue more tractable.

5 So, what I would suggest is rather than do
6 guidelines is that you offer more guidance, beginning
7 with someone writing a nice paper about just exactly what
8 the FTC has done in all those drugs cases, you know, why
9 they've done it, how they've done it, the arguments that
10 have occurred. Try to make it relatively neutral, at
11 least in part.

12 So, again, more guidance for sure. I'm not
13 sure we're ready for guidelines.

14 MR. SHAPIRO: Bob?

15 MR. PITOFISKY: I agree entirely that defining
16 an innovation market and the measuring market share is
17 much more difficult than other efforts that we've engaged
18 in because so many innovation markets suggest ideas, and
19 after spending a hundred million dollars, it turns out
20 the idea isn't going to go anywhere. So, I agree that as
21 a preliminary, the people who are going to revise the
22 next set of guidelines should take a look at what
23 happened over the last 20 years in terms of innovation,
24 get some statistics together.

25 But then to opt out and not give as much

1 direction as we can to the public sector about market
2 definition and market share, I talked about market share
3 in my initial remarks. I know how difficult it is. But
4 people have been working on it. There are articles on
5 it. RAP (phonetic) has an article on it. Judge Bork
6 wrote a little bit on it. It's not easily done the way
7 price analysis is done. But that doesn't mean that it
8 can't be done, or you do as much as you can, give as much
9 hint to the public sector as you can and move on from
10 there.

11 MR. SHAPIRO: Deb?

12 MS. GARZA: Yes. The AMC appreciated that --
13 directly in its recommendations and report that there is
14 an issue, about whether or not the agencies' thinking has
15 matured sufficiently to get guidelines, as Tim suggested.
16 And it is important, I think, that the guidelines
17 represent a consensus document and don't sort of
18 represent the flavor of the month club in terms of
19 economic thinking.

20 But what we saw with AMC was that the public --
21 the non-experts that looked at the -- the policymakers
22 that looked at the guidelines that seemed to be looking
23 at a static world and seemed to be really focused more
24 highly on price effects and didn't seem to, frankly, give
25 enough weight and consideration to innovation issues. I

1 don't think that's a true assessment of what actually
2 happens at the agencies. I think when the agencies do
3 their analysis, they are thinking of competition in a
4 dynamic sense.

5 It's just that the nature of the guidelines
6 because of the way they were written, they were really
7 more focused on a sort of static competition world and
8 more on the price effects. I think the concern is that
9 they don't adequately leave room for consideration of the
10 effects on innovation, which, as Tim has said, can really
11 swamp any other effects or concerns.

12 So, even while you may not be able to specify
13 much in the guidelines about how you're going to look at
14 innovation issues, the AMC thought it was important to
15 make sure and clear that innovation is an issue and then,
16 frankly, urge that through this process of looking at the
17 guidelines and potentially revising them that there
18 should be a lot more work and thinking and articulation,
19 whether or not it's in the guidelines, but a lot more
20 articulation of the issues that are relevant to
21 innovation and merger analysis. So, whatever is in the
22 guidelines or outside the guidelines, you are pushing
23 forward the thinking in that area and articulating the
24 issue clearly, even if it's not in sort of the strict
25 structural guideline sense.

1 MR. SHAPIRO: Doug and then Jim.

2 MR. MELAMED: Just a couple of modest thoughts.
3 I don't claim any great expertise here, but here are my
4 thoughts.

5 One, I think, first of all, innovation has two
6 potential roles here. One is are we worried about harm
7 to some innovation in what some people would call the
8 innovation market? And the other is the prospective
9 future innovation and kind of efficiency benefit that one
10 might imagine from the merger. I think the analysis
11 might be different.

12 As to the former, my sense is to have great
13 skepticism about the value of defining innovation
14 markets, trying to figure out how to measure shares in
15 them and so forth. I think the whole premise of that
16 doesn't really apply. The whole premise of defining
17 shares is to figure out, you know, sort of whether
18 there's a likelihood of anybody being able to price off a
19 marginal revenue curve rather than a demand curve and
20 create some dead weight loss. But for innovation, the
21 issue is how are you going to be able to -- how you're
22 likely to shift the demand curve.

23 There's a tremendous incentive often, even for
24 a monopolist, to shift the demand curve. So, I'm not
25 sure that even if we could define an innovation market

1 and measure shares would tell us an awful lot about the
2 likelihood that incentives for innovation would be
3 affected. That's one thought.

4 The second thought is maybe the way to look at
5 innovation on either of these questions, the plus and the
6 minus, is to go directly to the question of whether we
7 think the transaction affects incentives to innovate?
8 Often, two big potential innovators might get together
9 precisely because they see potential synergies or, you
10 know, they can -- whether it's just spreading their fixed
11 cost of R&D or putting together two nutty geniuses in the
12 same room or whatever it is. But if they have incentives
13 to innovate, one ought to be worried about that.

14 On the other hand, obviously, there are
15 situations, I suppose, where an incumbent monopolist
16 might buy up a potentially disruptive innovator in order
17 to shut it down. But it seems to me that relevant focus
18 on the formality of market definition and shares, we
19 ought to be asking simply the question of, what do you
20 think this transaction does to incentives? Maybe that
21 ought to be a prime driver of the analysis.

22 MR. RILL: Doug picked up on a point, also,
23 that I was concerned about in thinking about innovation
24 and its inclusion in the guidelines. I think I agree
25 with Tim that it's probably not quite ready for prime

1 time if the guidelines are indeed considered to be prime
2 time because the learning is still on the way.

3 One has to look not only at, from the parties'
4 standpoint, the plus side of including innovation
5 analysis and the calculation of efficiencies, but also
6 the minus side of looking at the possible anti-
7 competitive effect analysis that will result from over-
8 inclusion of innovation output functions, innovation
9 firms in a merger case.

10 There's literature that pointed out -- a good
11 bit of literature out there, but some of the literature
12 is, I think, a little bit terrifying in the sense of
13 looking at the very broad-based possible inclusion in a
14 "market" of R&D functions that may be only functioning in
15 very distant, but nonetheless, theoretically related end
16 product categories with end products that became, for
17 example, treatment of a particular condition, or even a
18 related condition.

19 Some of the literature would include that in
20 looking at the possible anti-competitive effect of a
21 transaction between firms whose R&D capacity seemed to
22 be, at least on first analysis, going on quite different
23 tracks would put them in the same market and look to a
24 possible challenge to the merger on that basis.

25 So, I think great care has to be taken to

1 distill some of the literature and see how fundamentally
2 sound it is and how it would play in court and go back to
3 the principle of, is this an understandable standard that
4 would be tractable and flexible enough to make sense in
5 the guidelines? I think more has to be done with the
6 literature and possibly with the cases, certainly on the
7 competitive effects side and possibly not so much so on
8 the efficiencies side.

9 MR. SHAPIRO: We have two panelists who want a
10 second bite here. Bob?

11 MR. PITOFISKY: Very briefly. The implication
12 seems to be if you had an innovation market, the result
13 would be findings of anti-competitive effect and,
14 therefore, a decline in innovation. The guidelines
15 should also incorporate the notion that quite often,
16 mergers between firms that are engaged in innovation are
17 going to be very efficient, that they're going to be able
18 to combine technologies. That's the history that we had
19 with a related area which is R&D joint ventures. Not one
20 was found illegal for the first hundred years.

21 It seems to me that the guidelines ought to set
22 out the pros and the cons of consumer effects of
23 innovation markets.

24 MR. SHAPIRO: Briefly.

25 MS. GARZA: Very briefly. The AMC had not

1 actually recommended that there be focus on innovation
2 markets in the guidelines. But notwithstanding what Jim
3 and Tim have said, it seems to me that there's -- about
4 the state of the learning, it seems to me that there is a
5 sufficient consensus and, in fact, the agencies do look
6 at things like the effect of a transaction on incentives
7 to innovate.

8 Our proposal would be that in the competitive
9 effects discussion, one should at least articulate that
10 when you have a merger that is being driven by or
11 involves significant issues of innovation, here's the way
12 we're going to look at it. Here's the kinds of things
13 that we're going to be concerned about, like how it's
14 going to affect an incentive to innovate. And then the
15 flip side, indicating that the agencies will recognize
16 innovation-related efficiencies and how so, and to make
17 clear that two years is not a hard and fast rule and that
18 fixed cost efficiencies related to research and
19 development may have a real role to play.

20 MR. SHAPIRO: Well, let me push this a little
21 bit further before we move to another topic. So, it
22 strikes me as -- if we focus on incentive and ability to
23 engage in innovation, there's a pretty clear trade-off
24 such as we get in unilateral effects, which is if the
25 merging firms are -- if one firm's success would take a

1 lot of business away from the other, we have some rivalry
2 there that might be diminished by the merger that could
3 retard innovation.

4 On the other hand, they might be able to get
5 synergies or efficiencies. That could be articulated
6 without invoking any notion of innovation market and
7 simply explain the same type of analysis you would do,
8 perhaps with a longer time frame, that we do, to some
9 degree, for innovation and do routinely for other
10 dimensions of competition. Reactions to that? Doug?

11 MR. MELAMED: Very briefly. I think that makes
12 sense, but it does seem to me and those who know the
13 literature better than I, correct me if I'm wrong, that
14 the trade-off between diminished rivalry and diminished
15 incentive to innovate is a lot less direct than is the
16 trade-off between diminished rivalry and higher prices.
17 If I'm right about that, it seems to me that the agencies
18 -- the guidelines ought to note that rather than just
19 lead people to believe that, well, gee, a three-to-two
20 must be anti-competitive.

21 MR. SHAPIRO: Okay. So, your homework
22 assignment is to submit supplemental comments on why it's
23 less direct. He's pulling the microphone away from you
24 to agree.

25 MR. MURIS: It's not just a lot less direct.

1 It's that when you look at the literature, there are lots
2 of models that say it's better to have fewer firms
3 because you can capture the benefits to innovation. Now,
4 I think there's a very good paper by Katz and Shelanski
5 which I think does a good job. There are people who have
6 taken the insight that I've just said and said,
7 therefore, all mergers ought to be approved and
8 innovation is king and I think the Katz and Shelanski
9 paper does a good job of debunking that view.

10 It doesn't mean that we're dealing with the
11 same kind of insights that we have in product markets.
12 What it means is that if you are going to write anything
13 that reflects a consensus, it's going to be awfully
14 short. But, I think there would be great value to
15 looking -- just as we did with that data release, I mean,
16 I was surprised, I think everybody was surprised a little
17 bit where the numbers came out. Let's look -- the FTC's
18 got enough experience now in this area with the drug
19 mergers that I think it would be useful to collect it and
20 publish it.

21 MR. SHAPIRO: So, if we noted the importance of
22 appropriability, which is underlying, I think, your point
23 as part of incentives, would that assuage your concerns
24 or do you still think it's just too murky?

25 MR. MURIS: Well, fine, you add that, you've

1 got a few sentences. I don't mind saying that. But I
2 don't think it tells us a lot and it's not on a par with
3 what Jim said, you know, in terms of the prime time. And
4 you still haven't addressed the issue that, I mean,
5 outside of the drug mergers, it's a real murky issue --
6 unbelievably murky about trying to even identify who the
7 relevant parties are.

8 MR. SHAPIRO: Okay. Let me move to a different
9 topic that's also been brought up by a number of you,
10 which is, I would say, the decline of the structural
11 presumption, Jim, you referred to the flawed market share
12 paradigm. Tim, you mentioned adjusting HHI thresholds,
13 which, you know, is still using the paradigm, of course,
14 and we've already signaled that we're not departing --
15 planning to depart, if we do update the guidelines, from
16 the use of market definition and HHIs.

17 But given that there's -- it's not a consensus,
18 a lot of voices saying structural measures should get
19 less weight and we should do a more holistic approach, if
20 we move in that direction, which downplays the role of
21 market concentration as an indicator of competitive
22 effects and focus more on other ways of assessing the
23 facts, how can this be done without weakening merger
24 enforcement? To the extent that the structural
25 presumption is an important tool that the agencies use in

1 court, how do we do that?

2 MR. PITOFSKY: I don't think we can do it. I
3 agree that some structural presumption is not everything.
4 I know I've described it as a launching pad. It gets you
5 started and then you look at a lot of other factors. But
6 to say that 20 percent market share and 80 percent market
7 share are pretty much the same thing is going to diminish
8 the ability to enforce the antitrust laws.

9 MR. RILL: I think there's a lesson to be
10 learned from Europe here. There's not many, but
11 certainly one. The European 2004 guidelines in dealing
12 with market structure levels indicate that they're a
13 starting point for further analysis. I think as it has
14 developed in the United States, that's probably what they
15 are now, a starting point for further analysis. I think
16 the notion of presumption in the '92 guidelines is, at
17 most, a very weak presumption. I think the court
18 decisions very obviously bear that out, certainly at
19 levels other than, for example, two-to-one.

20 But does it weaken antitrust enforcement that
21 one needs to go on and look at competitive effects, other
22 measures of competitive effects, other empirical evidence
23 that would indicate that a merger might have adverse
24 competitive effects once a certain threshold for further
25 analysis has been cleared? I don't think the evidence

1 will bear that out.

2 I think that commensurate with the decline of
3 the power of the structural presumption, if you will,
4 there has not been a decline in merger analysis and
5 merger review. At certain levels, the presumption
6 remains in effect. I think there were flaws in the H. J.
7 Heinz decision, but it seems to me that if one accepts
8 the analysis of the decision, one can't argue with the
9 notion that if the facts were as stated, that there would
10 have been a very high level of proof shown to overcome
11 the fact that they allege this is a three-to-two merger.

12 You could argue with that finding, but
13 nonetheless, I think that shows there was not particular
14 a weakening of merger enforcement and a whole range of
15 decisions, such as Swedish Match and others, show that I
16 don't think there's been a weakening in either the
17 enforcement vitality of the agencies or of the courts'
18 decisions properly designed. So, I don't think the
19 presumption is there to necessarily add vitality to
20 antitrust enforcement in the merger area.

21 MR. SHAPIRO: Tim?

22 MR. MURIS: Well, two points. The success or
23 failure of the government in court I don't think has
24 turned one way or the other on the structural presumption
25 and, indeed, parties are so reluctant to take the

1 agencies to court, it happens very infrequently.

2 Second, and this is a point when I was
3 Chairman, I thought, do we want to redo the merger
4 guidelines? And I said, "no", because I believed in
5 consensus, but I believed we ought to lay the groundwork
6 for future visions by doing two things. Any revisions
7 have to address the numbers, but what are the numbers?
8 So, we did the data release and then the commentary on
9 actual agency practice.

10 Obviously, you're going to need to confront the
11 data and either accept it or explain it away in revising
12 the numbers.

13 MR. MELAMED: Just a brief final thought. You
14 know, the guidelines are not a statute. You can write
15 all the guidelines you want describing how the agencies
16 go about merger analysis. They could be reconciled with
17 a world in which the law says that there's a structural
18 presumption that we, the prosecutors, are going to tell
19 you how we're going to exercise our prosecutorial
20 discretion and you could have a world in which you don't
21 undermine the structural presumption except by the force
22 of an analysis that suggests that maybe courts, in their
23 wisdom, shouldn't give too much weight to the
24 presumption. But I think there are two separate
25 questions on what the law is and what the agencies'

1 preface ought to be.

2 MR. RILL: I'd just respond one second to that
3 point. True, the guidelines are not statutory. In fact,
4 I think Judge Thomas Penfield Jackson once described them
5 as an admission against interest by the government. But
6 the courts increasingly and you can cite cases, myriad
7 cases, where the courts have treated the guidelines,
8 noting that they're not law, but nonetheless enormously
9 persuasive by the expert agencies and follow the
10 guidelines as though they were almost stare decisis
11 precedent.

12 MR. SHAPIRO: So, it seems to me that the
13 reality is that to the extent the guidelines continue to
14 downplay the importance of market shares or Herfindahls
15 and say it's a starting point, but you don't get much
16 from that, it's very hard, isn't it, for the agencies if
17 they go to court than to put a lot more weight on that
18 measure?

19 Doug, were you saying otherwise?

20 MR. MELAMED: No, no, no, I'm saying you could
21 write around this problem if you were worried about it.
22 I actually think, in the spirit of what Jim was saying,
23 that if you articulate a tractable and sensible way to
24 analyze mergers at the agency, you shouldn't be worried
25 about the fact that it will weaken your litigation hand.

1 You ought to assume courts can apply it, too. But if you
2 wanted to draft around that, you know, you could try to
3 do it.

4 MR. MURIS: This is full rule of reason
5 analysis, especially in court. And I think that might be
6 a damning admission in some ways. After all these years
7 of doing mergers and studying mergers, you could think
8 maybe we could come up with some better shortcuts. The
9 reason I mention the facts is I think there are
10 occasional factual shortcuts. But the reality is is that
11 when in Section 1 cases they're always talking about
12 nobody does full rule of reason analysis. Well, mergers
13 are full rule of reason analysis and that's reality. I'm
14 happy with that myself.

15 MR. SHAPIRO: Well, the guidelines right now,
16 they have a disclaimer saying this is how we do things,
17 but it's not necessarily how we'll conduct litigation.
18 Should we drop that disclaimer and encourage the courts
19 exclusively to rely on the guidelines or just keep it the
20 way it is?

21 MR. MURIS: I don't think that --

22 MR. MELAMED: Option A.

23 MR. SHAPIRO: Drop it?

24 MR. MELAMED: Yeah, Option A, drop it.

25 MR. MURIS: I agree with that.

1 MR. PITOFSKY: I'm sorry, what is the
2 consequence of dropping it, that the courts are told not
3 to pay any attention to it?

4 MR. RILL: No, it's a gratuitous footnote that
5 was trying to get away from actually trying to align
6 burdens of proof and other technical litigation
7 strategies in the guidelines. I don't think it's for any
8 useful purpose now. I don't think the effect is to
9 weaken or strengthen the force of the guidelines.

10 MR. PITOFSKY: Vis-a-vis the courts.

11 MR. RILL: Right.

12 MR. PITOFSKY: I'll go back to the original
13 here. I think the guidelines tell you what the
14 enforcement intentions of the enforcement agencies were.
15 I don't believe the courts should be bound by them.
16 Maybe a little interest, but very little interest. Much
17 more bound by precedent, although there isn't an awful
18 lot of precedent.

19 MR. RILL: But the fact of the matter is that
20 the courts are feeling very much influenced by the
21 guidelines. Read the cases.

22 MR. PITOFSKY: A few of them have. Not that
23 many.

24 MR. RILL: There aren't that many cases.

25 MR. PITOFSKY: I stick by what I say, still not

1 that many. But you're right, that's the reason.

2 I think the judges should do their jobs. The
3 guidelines are for the purpose originally intended, to
4 give people an idea of what the enforcement agencies are
5 likely to do.

6 MS. GARZA: Carl, can I just -- I don't know
7 about dropping the footnote, keeping it. The fact of the
8 matter is what the agencies will look at and how they
9 assess a merger is one thing and how courts try merger
10 cases is another, and I don't think the guidelines should
11 worry about things like the allocation of burdens and the
12 various tools that the courts will use to help them
13 assess the evidence and, frankly, I know that there is
14 always a concern and has been a concern by the agencies
15 about how the guidelines might affect their litigation
16 success. But to be frank, I think it's incumbent on the
17 government to make its case in court under the rule of
18 reason. And, frankly, if the judge is reaching for the
19 merger guidelines to rule against you, chances are you've
20 already lost him or her on the merits of the case.

21 MR. SHAPIRO: Tim, you mentioned the commentary
22 that was released in 2006 and there's a lot of good stuff
23 in there. We asked in our public questions whether there
24 were parts of it that might be incorporated into the
25 guidelines themselves. I guess I want to ask you not so

1 much to mention specific parts of the commentary, any of
2 you, but what is the role of these adjunct documents and
3 should we take parts where there is a consensus, for
4 example, and move it into the guidelines? How should we
5 view that commentary which is the latest, you know,
6 systematic statement as we undertake this project?

7 MR. MURIS: Sure. Well, when we -- at least
8 for myself, I envisioned the commentary as the purpose of
9 it was to reflect the actual practice. Multi purpose for
10 when somebody sat down to revise the guidelines.

11 Also, I think the commentary does something
12 that's quite useful and probably wouldn't work in the
13 guidelines. All the case examples. And I think, you
14 know, occasionally doing that in whatever form is
15 helpful. Although the people who worked on the
16 commentary will agree with this, is cooperation between
17 the two agencies can sometimes be strenuous. I'm looking
18 for a delicate word here. I guess that wasn't one. I
19 think that something like the commentary can be done more
20 frequently with relative ease than revising the
21 guidelines. So, I think they're complements as opposed
22 to substitutes, although partly again I think any
23 revision should reflect some of the consensus that's in
24 there.

25 MR. SHAPIRO: Doug?

1 MR. MELAMED: I'm not sure I disagree with Tim,
2 but just a note of concern about the last point he made.
3 It's precisely because the commentary can be published
4 with less angst that one has to wonder whether if we get
5 too accustomed to commentary, we don't simply have the
6 whim of the current, you know, senior staff at an agency,
7 rather than something that is more considered and more of
8 an enduring reflection hopefully both agencies use.

9 MR. SHAPIRO: Okay. Tim, again, you mentioned
10 there are a lot of examples in the commentary. We posed
11 the question whether or not -- let's say not real world,
12 but hypothetical examples might be valuable in the
13 guidelines. They're in the IP licensing guidelines,
14 about ten of them. There's about ten in the
15 collaboration guidelines. As a professor, I find them
16 rather helpful as a pedagogical tool. That would be a
17 change for the merger guidelines. A good change or
18 perhaps note? Comments?

19 MR. RILL: I'll try. There are, to be sure,
20 one or two examples in the 1992 guidelines. I don't
21 think they're very happy examples. I will only say that
22 there's some merit to what Tim suggested and that is that
23 joint effort is very strenuous. You can read into that
24 what you'd like.

25 In the merger area -- and I've read the IP

1 guidelines and the international guidelines carefully and
2 I think the examples are quite good. I think the merger
3 area and its companion rule of reason analysis makes it
4 much less amenable to examples that are particularly
5 useful because the rule of reason analysis is so specific
6 that a slight change in some of the underlying and
7 factual basis, empirical basis for the analysis could
8 change the outcome of the answer to the question that
9 might be posed in the examples.

10 I think examples are much more appropriate for
11 speeches and possibly commentary than they are in the
12 guidelines because there are too many variables that
13 could go into the production of the example that could
14 make a slight change in the variables so that you come
15 out with a different answer.

16 MR. SHAPIRO: Okay. Do others want to comment?

17 MR. MURIS: Well, as an academic, I generally
18 like examples, but examples here seem odd given the
19 hundreds of actual examples of cases you've got. If you
20 want to pull an example, you do what the commentary did.
21 People don't want to do that to protect the innocent or
22 whatever.

23 Second, it would fundamentally change the
24 nature of the guidelines in the sense that given so many
25 different points in the guidelines, I don't think you

1 could just sprinkle them through. You'd have to have a
2 lot. It would change the document significantly. I
3 mean, maybe that's a good thing. I think inertia and
4 precedent probably say it's not, but I suppose I could be
5 persuaded otherwise.

6 MR. MELAMED: Let me try to start persuading
7 you otherwise or at least suggest this. I thought Tim's
8 comment about there are so many mergers and how can you
9 have examples is odd because there are examples in the
10 non-merger guidelines where there are vastly more actual
11 transactions and litigated cases and, nevertheless,
12 examples were workable there. That's thought one.

13 Thought two, yes, if the agencies can't agree
14 on a set of examples, then you shouldn't scuttle the
15 whole project, just get rid of the examples. But I'm not
16 sure it would be a bad idea or definitely I think it
17 might be a good idea only if you only had a handful of
18 examples rather than an example illustrating every
19 important analytical point.

20 To put into the guidelines examples drawn upon
21 some very illuminating things the agencies have done in
22 years, such as the explanation of the Genzyme and cruise
23 line cases, which are extremely valuable, and perhaps
24 could be brought in at a key point when you're talking
25 about certain kinds of data or incentives in innovation

1 or whatever. Even if you didn't have 40 examples, you
2 actually only had a half a dozen, I think it might be
3 illuminating.

4 MR. SHAPIRO: Okay. Let me just give each of
5 you a chance for a minute or two if there's some last
6 remark you want to make, having heard this discussion.
7 I'm surprising you with this perhaps, but reactions
8 overall.

9 MR. RILL: Well, I will simply start and say
10 that the entire process that you're undergoing right now
11 provides an enormously beneficial perspective and it
12 seems to me that panels such as this, and perhaps even
13 more so the panels which will be following on, are going
14 to, in themselves, I think, add significantly to the
15 learning that's going to be evolving around the
16 discussions that are taking place, regardless of whether
17 there's a revision or not. And I think that, as I've
18 indicated and the other panelists have indicated, there
19 are areas that are ripe for revision.

20 I look particularly towards the unilateral
21 effects panel at the close of the day. So, I applaud the
22 process. I think it's worthwhile in and of itself even
23 if nothing more comes out of it than the learning that
24 could be extracted from the panels.

25 MR. SHAPIRO: Thank you, Jim. Tim?

1 MR. MURIS: Well, maybe you've already done
2 this or have a sense of doing it, but the questions that
3 you've asked are very open-ended and could lead to a
4 fairly wholesale revision. At some stage, I think you
5 should communicate publicly, you know, before you
6 actually write whatever you're going to write that you've
7 decided for X, Y, Z reasons to focus on, you know, A, B
8 and C. You have embarked on an effort that is
9 praiseworthy, but immense and, to use the word again,
10 potentially strenuous.

11 MS. GARZA: Just echo what others have said. I
12 think as you go forward, I think it's going to be
13 important not to try to make the guidelines carry too big
14 a load. You can't make them do more than they should do.
15 I think that what they should do is mainly to communicate
16 to those who are subject to government enforcement what
17 the rules of the road are to the extent possible, provide
18 certainty, provide transparency. Don't worry so much
19 about trying to move the courts and, so therefore, don't
20 load too much into the guidelines. Remember, as others
21 have said here, it's not regulation; it's really just an
22 articulation of the general way in which the agency will
23 look at certain factors and what factors it will look at.

24 MR. SHAPIRO: Well, thank you all. Let me just
25 set up a little bit of what's to come the rest of the day

1 in the context of what we just heard. We sort of
2 consciously steered clear of some of the more specific
3 issues, such as, how are we going to deal with unilateral
4 effects or the market definition, the algorithm and the
5 SSNIP test because those are going to be treated later
6 today and some of the other topics we didn't have time
7 for, such as much on efficiencies will be addressed in
8 other workshops.

9 The very next panel is on direct evidence. I
10 think that fits very nicely with one of the themes -- I
11 attempted to say consensus here -- that as we put less
12 weight on market shares alone and do the more full
13 analysis, perhaps starting the way Doug described it,
14 that there are a variety of different types of evidence
15 we look to and the guidelines, while sound in structure,
16 don't say much about how we do that.

17 So, please stick around to hear that and other
18 panels. We're going to take a 15-minute break. Please
19 join me in thanking this panel.

20 **(Applause.)**

21 **(Panel 1 concluded.)**

22

23

24

25

PANEL TWO: DIRECT EVIDENCE OF COMPETITIVE EFFECTS

COMMISSIONER KOVACIC: Welcome back. We're going to turn now to the topic that was touched upon in the first session and that is the use of direct evidence of competitive effects in merger analysis. We're all familiar with the much quoted line in many a judicial opinion that says, almost invariably, that the starting place for analysis in a Clayton Act Section 7 merger case is the definition of a relevant market and the measurements of market shares.

A great deal of theory and applied work, certainly in the last 20 years or so, has turned back to the possibility, recognized in principle from the very beginning of experience with the Sherman Act, that it would be ideal, instead of using proxies, to directly assess the likelihood or the fact of anti-competitive effects. And that possibility has been recognized in a number of cases outside of the Section 7 area and touched upon in the FTC's administrative proceedings and in Evanston, and we're going to look in more detail at the use of direct effect evidence of competitive effects as a way to assess mergers.

We're going to have basically 10-minute presentations by each of our panelists and then time for discussion. We have a terrific mix of folks who have not

1 only had opportunities as academics and practitioners to
2 deal with these issues, but have done so inside of the
3 public enforcement community as well.

4 Judge Doug Ginsburg, the Judge on the U.S.
5 Court of Appeals for the District of Columbia and
6 formerly the head of the Antitrust Division; Leslie Marx
7 from the Duke Business School at Fuqua and also with
8 Bates White; Leslie, formerly Chief Economist of the
9 Federal Communications Commission; Rich Parker with
10 O'Melveny and Myers, a partner there, also formerly the
11 Director of the Bureau of Competition at the Federal
12 Trade Commission; Mark Popofsky, now a partner at Ropes
13 and Gray, but also past holder of several key management
14 positions at the Department of Justice Antitrust
15 Division; and Bobby Willig, Professor at the Wilson
16 School at Princeton, Principal of Compass Lexecon and
17 also formerly the head of the Economic Analysis Group at
18 the Department of Justice, who had a little bit to do
19 with the 1992 guidelines as well.

20 So, a fantastic combination of not simply
21 enforcement experience, but also practice outside the
22 agencies. They've looked at the merger guidelines from
23 both sides and will be addressing this dimension of it.
24 And if I could ask Doug please to get us started.

25 JUDGE GINSBURG: Thank you, Bill. I'm pleased

1 to be here and to know that the Division and the
2 Commission are proceeding in such an openly, scholarly,
3 informed way to the question of whether and how to revise
4 the guidelines.

5 I am here in my capacity, as Bill said, as a
6 Judge, not at all as an economist. So, I ask you to
7 forgive any misstatements that may be made. I make this
8 disclaimer whenever there's a real economist in the room.
9 And, also, in my capacity as a collector of tidbits in
10 films that lampoon government agencies. So, if anyone
11 has suggestions, I hope they'll let me know later on.
12 Perhaps my favorite relevant to this morning is from
13 Ghostbusters. Toward the end, Bill Murray finds himself
14 in the bedroom with -- was it Susan Sarandon? Sigourney
15 Weaver, pardon me. Sigourney Weaver, and putting aside
16 the context, which some of you will know, says, The EPA
17 has a rule against sleeping with the possessed.
18 Actually, it's just a guideline.

19 **(Laughter).**

20 JUDGE GINSBURG: Now, I haven't yet seen The
21 Informant, but having read the book, I trust that some of
22 us in the room may have been lampooned in that effort.
23 So, I look forward to that.

24 I have a couple of messages and I hope they're
25 clear and simple. The first is this, in talking about,

1 thinking about direct evidence of competitive effects in
2 a merger context at least, the order of the day should
3 be, in my view, simplicity. That is to say, in thinking
4 about this with an eye to how it's going to be played out
5 in court, which often it won't be, but that seems to be
6 the failsafe assumption, the best direct evidence is
7 empirical, historical evidence from which you can readily
8 extrapolate.

9 Darren Tucker, who I think is here at the FTC,
10 right?

11 COMMISSIONER KOVACIC: Yes.

12 JUDGE GINSBURG: And may be here today, I don't
13 know. In a recent article said, examples of direct
14 evidence include a natural experiment showing the effect
15 of a change in concentration or number of competitors,
16 documentary or other evidence showing an acquiring
17 company's post-merger plans and changes in prices are
18 output from a consummated merger. Now, these are all
19 desiderata, of course, much to be desired, but going to
20 be available only in select cases. So, it's often going
21 to be necessary to do something well beyond that.

22 One such case, of course, was mentioned
23 earlier, I think was Evanston Hospital. But that
24 happened to be a consummated case and, so, there was
25 price experience about which the Commission and the

1 parties could argue in light of the elapsed time, I think
2 four years, between the consummation of the deal and the
3 challenge. But the question there was whether the
4 Commission could define the market based on econometric
5 evidence, but the econometric evidence was, in turn, an
6 analysis of empirical price data.

7 In the recent airline filings, the Continental
8 request for immunity from the Department of
9 Transportation in switching from Sky Team to Star
10 Alliance, the data suggested that nonstop service is a
11 separate product market and the Department, using cross-
12 sectional analysis of fare data, showed that fares paid
13 by nonstop passengers increased typically, on average, 15
14 percent in two-to-one transactions and 6 and two-thirds
15 percent when nonstop carriers went from three-to-two.

16 As for whether the nonstop trans-Atlantic
17 market is a separate market, I can hardly imagine that
18 there's much of a market for service that stops while
19 going across the Atlantic. I'm not sure what it would
20 entail.

21 **(Laughter).**

22 JUDGE GINSBURG: Maybe just as you've described
23 elsewhere, departures without arrivals.

24 **(Laughter).**

25 JUDGE GINSBURG: Staples is, in a way, the

1 prime example, especially since it's been ventilated in
2 the District Court, where, of course, there were
3 excellent data available. The parties could argue over
4 the quality and meaning of the data, but the cash
5 register data were, I thought, compelling and showed the
6 effect of whether Staples was facing two or one other
7 similar office supermarkets.

8 Now, when this kind of data are available, it
9 seems to me quite clear that one ought to avoid the more
10 laborious methods of defining a market and try to do so
11 in this rather more analytical data intensive way when
12 it's possible. To the extent that there are limitations,
13 and even when you have data, you're going to be drawn
14 into using econometric models, and that's where the
15 difficulties really start to ensue.

16 I don't know if Greg came back after the break.
17 He did. But Greg Werden and Luke Froeb and David
18 Schefman had an excellent piece called a Daubert
19 Discipline for Merger Simulation in one of the antitrust
20 journals recently and I'm just going to quote a few
21 sentences. They're not connected on the page as they are
22 when I read them.

23 "The basic economic theory underlying
24 unilateral effects from horizontal mergers is deceptively
25 simple, but behind this simple story is a complex game

1 theoretic model replete with assumptions about how
2 consumers, retailers and manufacturers behave and
3 especially about how competing manufacturers interact
4 with each other and with retailers. By specifying a
5 particular model, it is possible to make quantitative
6 predictions of the price effects of branded product
7 mergers. It is important to assess the reliability of
8 these predictions, yet there is scarce empirical evidence
9 on their accuracy in predicting actual price effects of
10 mergers."

11 Now, what the authors have done is approached
12 this all through the lens of Daubert and what constitutes
13 admissible expert testimony, which I think is a very
14 sensible perspective, one of several that one should take
15 in thinking about guidelines along these lines. And the
16 important point that they make is, "Any model used to
17 predict the effects of a merger must fit the facts of the
18 industry in the sense that the model explains past market
19 outcomes reasonably well."

20 Now, of course that's all going to be subject
21 to adversarial testing. So, it's all the more important
22 that that criterion be met.

23 There are at least two cases in which courts
24 have essentially rejected expert opinion based on the
25 kinds of models that we're talking about here, both in

1 the Eighth Circuit. In Concord, "The expert opinion
2 should not have been admitted because it did not
3 incorporate all aspects of the economic reality of the
4 sterndrive engine market and because it did not separate
5 lawful from unlawful conduct."

6 And from California Northern in the American
7 Booksellers case, "The expert's model contains entirely
8 too many assumptions and simplifications that are not
9 supported by real world evidence."

10 I think these are fair indications of the
11 threshold that Daubert sets for this kind of evidence in
12 court.

13 Now, something that may be less obvious is, it
14 seems to me, that there's some utility to be derived. I
15 have not done this, I leave it to the agencies' concern.
16 But I think there's some utility to be derived from
17 looking at the experience of the courts, and I'm familiar
18 with some of the cases in the D.C. Circuit, in accepting
19 and rejecting conclusions based on models other than in
20 antitrust cases, sometimes other than economic models. A
21 lot of these come up, both economic and other models, in
22 environmental cases. And you see arguments about
23 attacking the results by attacking the model on the
24 ground that some allegedly important phenomenon was not
25 factored in.

1 There are a number of cases in which
2 proceedings have gone for years through the Environmental
3 Protection Agency, and have been, at the end of the
4 process, thrown out because of this kind of flaw in the
5 model, and other cases in which the tolerance of the
6 courts for the fact that a model is inherently a
7 simplification, inherently is going to disregard certain
8 data as inessential, is also accepted before the courts.
9 So, trying to do a typology of those cases I think would
10 inform one's judgment on approaching anything to put into
11 the guidelines on direct evidence.

12 Finally, a couple of procedure comments. As I
13 said, I think these workshops are an excellent way to
14 begin, considering whether to and how to revise the
15 guidelines. I think it's also important before making
16 those revisions to solicit comment on proposed changes.
17 I'm not sure whether that's been done in the past in
18 revisions of our guidelines. It's been done in other
19 jurisdictions, most recently perhaps in China, which went
20 through several rounds, both in statutory drafting and
21 then in drafting regulations of soliciting and analyzing
22 public comment.

23 I think I should leave it at that.

24 COMMISSIONER KOVACIC: Thanks for getting us
25 off to a great start, Doug, both with respect to

1 suggestions about the substantive approach, but how to go
2 about this as well as a matter of process.

3 If I could turn now to Leslie, please.

4 MS. MARX: I appreciate the opportunity to
5 participate in the panel and thank the organizers, Carl
6 Shapiro and Rich Feinstein, for putting together today's
7 workshop, and I commend the FTC and DOJ for opening the
8 debate about possible revisions to the horizontal merger
9 guidelines.

10 The questions for public comment that were
11 issued by the FTC and DOJ raise issues related to the
12 unilateral effects portion of the guidelines, and the
13 last panel today is devoted to unilateral effects.

14 Although coordinated effects do not get much
15 play in the request for comment, I believe coordinated
16 effects require and deserve attention. In fact, it may
17 be that coordinated effects are the more significant
18 concern, particularly if coordination involves a
19 suppression of rivalry among a much larger group of firms
20 than simply those involved in a merger. It certainly
21 does not make sense for competition authorities to
22 emphasize their success in cartel enforcement, while at
23 the same time ignoring coordinated effects in merger
24 reviews.

25 The FTC lost a case based on coordinated

1 effects arguments in Arch Coal in 2004 and, to the best
2 of my knowledge, has not gone to trial with another case
3 based on concerns about coordinated effects since then.

4 The FTC needs to be secure in its ability to
5 take action against mergers where coordinated effects are
6 a concern. Otherwise, firms that think there would be
7 gains for a merger due to coordinated effects are going
8 to pursue those mergers to the detriment of consumers and
9 competition.

10 Coordinated effects were included in the
11 horizontal merger guidelines because they were believed
12 to be an important issue. But, overall, there appears to
13 be a disparity between the analytical thinking that is
14 expected from a unilateral effects analysis and what goes
15 into the typical coordinated effects analysis.

16 The guidelines ask for arguments about the
17 likelihood of post-merger coordination. I view this as a
18 deficiency in the current guidelines. I would propose a
19 revision to the guidelines approach to coordinated
20 effects that focuses on how merger affects the pay-offs
21 to coordination. Pay-offs can be quantified using
22 standard economic techniques and give us an indirect
23 measure of likelihood given the presumed positive
24 relation between the two.

25 How can we quantify a merger's effect on the

1 pay-offs to coordination? This is a research problem
2 that I've worked on and I have published work with
3 coauthors that supports my comments today.

4 Merger analysis tends to focus on unilateral
5 effects, so presumably there would be a model of
6 competition allowing the measurement of the unilateral
7 effect of a merger. Generally speaking, whatever
8 techniques are used to measure the effect of a merger
9 between two firms in an industry can be extended to
10 measure the effects of additional or alternative
11 consolidation involving the other firms in the industry.
12 Thus, we can use standard unilateral effects models to
13 quantify the change in pay-offs to coordination that
14 results from a merger.

15 This type of measurement would give you the
16 pay-off associated with coordination that is sufficiently
17 well organized to be tantamount to a merger. In that
18 sense, this type of quantification provides an upper
19 bound on the pay-off from coordination.

20 One could argue that it does not provide a
21 quantification of the merger's effect on the pay-off from
22 say a slight increase in tacit cooperation or something
23 else falling short of perfect explicit collusion. But
24 it's more informative than what's done now. If the upper
25 bound on the merger's effect when the pay-off from

1 coordination is small, then there's no need to worry
2 about the merger's effect on incentives for tacit
3 cooperation. If that bound is large, then there's a lot
4 more room for thinking about other contributors.

5 The machinery for this line of analysis is
6 immediately available to any economist who has conducted
7 a unilateral effects study. The analysis would only
8 augment whatever's currently being done and could be done
9 at relatively low cost because it just extends analyses
10 already conducted.

11 Let me give a quick simple example. Suppose
12 there are four firms in an industry cleverly labeled A,
13 B, C and D, and we can let D be small. Suppose A
14 proposes to acquire B, but there are concerns about
15 coordinated effects involving C. First, we can calculate
16 a bound on the incremental pay-off from coordination
17 prior to the merger by contrasting the pay-offs in the
18 pre-merger market with those predicted by the unilateral
19 effects model applied to a merger of A and C.

20 Next, we can calculate a bound on the
21 incremental pay-off from the coordination after the
22 merger by using the unilateral effects model for the
23 merger of A and B and contrasting that with the
24 unilateral effects model applied to the merger of A, B
25 and C. Comparing these two bounds, we have a

1 quantification of the change in the incremental pay-off
2 from coordination as a result of the merger.

3 The questions for public comment ask about the
4 possible role of evidence of head-to-head competition.
5 This would be pertinent to, for example, the recent JBS-
6 National Beef and CSL-Talecris cases, and any merger
7 involving a so-called maverick firm. The current
8 guidelines raise the notion of a maverick firm saying
9 coordinated interaction can be effectively prevented or
10 limited by maverick firms, firms that have a greater
11 economic incentive to deviate from the terms of
12 coordination than do most of their rivals.

13 The guidelines seem to view a firm's status as
14 a maverick as some exogenously given and unchangeable
15 characteristic of a firm. But so-called maverick
16 behavior is a strategic decision of a firm, not an
17 exogenous characteristic. The guidelines are written as
18 if a maverick's behavior is that of a wild animal.

19 **(Laughter).**

20 MS. MARX: Rather than the behavior of a
21 profit-maximizing firm in the marketplace. We must
22 remember that maverick-like behavior might be a strategic
23 decision by a firm designed to improve its position in a
24 post-merger cartel.

25 By using the approach of extending a unilateral

1 effects analysis, no additional data or information is
2 required, assuming the unilateral effects analysis has
3 the flexibility to be extended to other potential
4 mergers. We would expect this to be true unless there's
5 something special about the model used for unilateral
6 effects that means it can only be used to examine a
7 merger between the two firms being considered and cannot
8 be extended to consider other potential mergers.

9 Furthermore, the approach I discussed can
10 incorporate an array of different aspects of a merger and
11 post-merger coordination. For example, it allows the
12 quantification of pay-offs associated with the inclusion
13 or exclusion of various firms in the post-merger cartel,
14 allowing the identification of the profit maximizing
15 cartel membership, which would be of most concern to the
16 agencies.

17 It allows the quantification of the pay-offs
18 associated with deviations for inclusive behavior,
19 providing information about the stability of various
20 post-merger cartels. It allows the calculation of the
21 efficiency gains that would be required to offset the
22 potential loss in consumer surplus from coordinated
23 effects. And it allows the quantification of how
24 required divestitures might mitigate a merger's effect on
25 the pay-offs from coordination.

1 I'm not alone in advocating for more rigorous
2 coordinated effects analysis. For example, Andrew Dick,
3 in a 2003 law review article, argues in favor of more
4 rigor. But his focus is on the constraints that prevent
5 coordination in an industry, and it's not clear what
6 analytic tool one would bring to bear in this case.

7 I propose a different guiding question.
8 Instead, I would ask, how does the merger change firms'
9 incentives to overcome whatever constraints on
10 coordination might exist, including how the merger
11 changes incentives for an apparent maverick to behave as
12 a maverick?

13 In recent articles by Davis, and Sabatini, and
14 Davis and Hughes, authors have proposed quantifications
15 using a particular model of tacit collusion. That's
16 another approach that also provides valuable information.
17 It's a different approach in that it produces an estimate
18 of the pay-offs associated with a particular type of
19 cooperation where one might argue about whether or not it
20 is feasible or likely for that type of arrangement to be
21 implemented.

22 Our approach avoids the issue of likelihood
23 completely and focuses on what level of profits are
24 available to the firms should they find a way to overcome
25 whatever obstacles they face in organizing coordinated

1 behavior. The greater the available pay-offs, the
2 greater should be our concern that creative minds focused
3 on profit maximization will find a way to achieve those
4 profits.

5 The opposition to the merger in Arch Coal,
6 based on coordinated effects, may well have been correct,
7 but the arguments presented in that case were not
8 compelling to the courts. Yet, since Arch Coal, U.S.
9 authorities and the European Commission have successfully
10 pursued many price fixing conspiracies. In other words,
11 the agencies remain vigorous enforcers of Section 1 of
12 the Sherman Act, recognizing the ongoing threat to the
13 competitive process from cartels and collusion. It's
14 important that the agencies be able to map this concern
15 into merger reviews.

16 To conclude, I think it would be valuable to
17 recognize in the guidelines that the discipline of
18 economics has much to say about post-merger pay-offs from
19 coordinated conduct and that thus we have much to say
20 indirectly about likelihood since it is reasonable to
21 believe that likelihood of post-merger coordination
22 increases with the pay-off from such conduct.

23 COMMISSIONER KOVACIC: Thank you, Leslie. In
24 many ways, when we think about the topic of direct proof,
25 it often comes up in the context of unilateral effects

1 analysis and your presentation very usefully focuses on
2 the possibilities of thinking about coordinated effects
3 as well and that's a very valuable part of the session.

4 Rich?

5 MR. PARKER: I want to thank everyone for
6 inviting me, the organizers, and I'm certainly going to
7 try to say something from my own perspective and
8 experience that I hope will be helpful.

9 I think it is very important that the merger
10 guidelines reflect actual agency investigational
11 practice. Actual agency investigational practice, in
12 turn, has to be calibrated to turn out cases that can be
13 tried successfully because we all know that only a
14 federal judge in the United States can stop a merger from
15 closing and, ultimately, these cases have to be
16 presented. And I think what's important is that there be
17 agency practice that makes a winnable case and that the
18 guidelines set forth what that practice is.

19 My experience in trying cases in Federal
20 District Court, merger cases both for and against the
21 government, is that the district judges are concerned
22 about effects. They are concerned about whether
23 customers are going to be hurt and they are concerned
24 about the mechanism by which they're going to be hurt.
25 And the government has to explain that, whether there's

1 going to be coordination or whether it's going to be some
2 form of a unilateral price increase simply because
3 they're so big or because they have some close substitute
4 type issue. The government has to explain that.

5 The best evidence of that is direct evidence.
6 And what I call direct evidence is anything other than a
7 presumption for market shares. The best evidence, of
8 course, in my opinion, is a natural experiment. And
9 generals always fight the last war. So, I mean, in
10 Cardinal Health, which I tried back in 1998 with Mike
11 Antallics and others, we had a couple of instances that
12 showed what happened when the merging parties entered
13 California and we saw prices go down. And now that
14 merging party is going to be out. It's pretty obvious
15 what's going to happen when that merger closes.

16 Staples is probably the best example where we
17 have evidence of what happens where two stores are across
18 the street from one another and what happens when they're
19 not. Pretty obvious, it seems to me to a federal judge,
20 almost all of whom are not antitrusters, as to what's
21 going to happen. That's the most important evidence.

22 I think party documents are extremely
23 important. Those of us who represent large companies
24 know that they spend a lot of energy with a lot of very
25 bright people trying to figure out what's going to happen

1 when this merger closes before they invest a gazillion
2 dollars of their shareholders' money in this, and so,
3 those documents can be very instructive. And by the way,
4 many of them, obviously, are not going to help the
5 government. They're going to help the parties. But I
6 think those are very important expressions of what is
7 likely, under the standard, to occur after it closes.

8 There are also other kinds of documents. Many
9 of you may remember that I once had a document where a
10 senior executive said that would-be pricing synergies of
11 this merger we should be able to get an immediate 15
12 percent price increase. I think that is very bad for the
13 party, very good for the government, but pretty doggone
14 good evidence as to what is going to happen. And I think
15 that is what is important in trying a case.

16 I want to talk about two things and where does
17 the structural presumption fit in and where do all the
18 economics fit in. Starting with the structural
19 presumption, I think it's very important for the
20 government that it have that because it gets you off to a
21 good start. But I don't believe, for one minute, that a
22 federal judge is going to be moved by the structural
23 presumption alone. They're going to want to know
24 whether, in reality, somebody is going to get hurt. The
25 defense always has the argument -- and trust me, I've

1 made it before -- that the government, they're talking
2 presumptions and they can have every presumption under
3 the sun, but I've got the facts.

4 And when trying a case for the government, you
5 ought to say, you know, Your Honor, we do have this
6 presumption. That's what the Supreme Court says.

7 Absolutely. But I'll tell you something, let's pretend
8 like it's not there. I'm going to show you what's going
9 to happen to these people. I'm going to show you why
10 there's something the matter with this merger and why
11 people, the customers, who we're supposed to protect, are
12 going to get hurt.

13 So, I think you want the presumption just
14 because it's in the law and because it's modestly
15 helpful, but don't anybody think that it's all that
16 helpful to the government and that you somehow need it to
17 win a case. I don't think the judges are all that
18 impressed with it.

19 The economics. I respect the economics
20 profession, I respect the scholarship that goes into all
21 these tests. But I've never been in a case where I
22 didn't have PhD on my side say that other side's test
23 isn't any good or the data isn't any good or something
24 and there's a better test that should have been applied
25 and it comes the other way.

1 Of course that ought to be part of a case, but
2 in my opinion, if I'm the government, the way I want to
3 end my case is I want to say, I have presented direct
4 evidence, I've presented natural experiments, I've looked
5 at the parties' documents, I've looked at this, that and
6 the other thing, I've got customers who say how they
7 benefit from the competition among these parties, and by
8 the way, we've done the best economics can do with some
9 tests and they corroborate the direct evidence. Now,
10 that's a case that's going to win. And on the defense,
11 obviously, I'd make the same point. The direct evidence
12 is on my side and this test we've run corroborates it.
13 But I think that's where they fit in.

14 All right, this is an exercise in revising the
15 guidelines. What are the practical implications of this?
16 I find myself agreeing with a speech that Commissioner
17 Tom Rosch gave a few weeks ago -- I think it was last
18 month -- where he said that market shares and HHIs and
19 whatever and however you revise them should not be set up
20 as a gating issue the way they are in the guidelines now
21 because I don't think they are, in practice. Anybody who
22 deals with the agency knows they're not. The commentary
23 says they're not. They shouldn't be set up that way.

24 I would set up and I would start the guidelines
25 off by saying the fundamental question -- they say it

1 fancier than this -- but the fundamental question is
2 whether customers are going to get hurt and we're looking
3 for evidence about whether or not they're going to get
4 hurt and here are some examples of the kind of stuff we
5 look for.

6 Next point, markets, yes, we define markets.
7 Yes, we look at concentration. But please note they're
8 going to be more important in some cases, that is
9 coordinated cases, than in other cases. And, so, that
10 would be the way that -- that would be my own practical
11 suggestion as to how to deal with the guidelines. I
12 mean, it's not a huge revision. I think a lot of this
13 work was already done in the commentary.

14 You simply talk about we're looking first and
15 foremost about direct effects and talk about the kinds of
16 things that -- the kinds of evidence, maybe examples or
17 something, of what you want and then talk about where
18 market concentration comes in. Not as a gating issue,
19 but as basically another form of analysis that I said is
20 going to be more important in some cases or other.

21 I think if you do that, you would have some
22 output that would be helpful to parties trying to
23 understand what happens down here and, frankly, would be
24 at least helpful to courts in understanding basic
25 antitrust analysis.

1 COMMISSIONER KOVACIC: Thank you. Thank you
2 very much, Rich, for, again, tying together your own
3 experience in the courtroom, but also thinking about how
4 things went when you were bringing the cases yourself and
5 how that might actually affect the recasting of the
6 guidelines themselves.

7 I'd turn to Mark, please.

8 MR. POPOFSKY: Thanks, Commissioner, and thanks
9 to the organizers and it's a pleasure to be here.

10 I start from the same position as Brother
11 Parker to the left, that direct evidence covers a broad
12 array of stuff. I mean, it's essentially anything other
13 than the structural presumption in establishing a prima
14 facie case of illegality. This is a vast topic and it's
15 really the heart of the merger guidelines. Several
16 panels later today, we're going to explore particular
17 facets of it, but this is a great bio-diversity of
18 antitrust here.

19 We had Professor Marx talk about a model as
20 part of direct evidence. We had Judge Ginsburg talk
21 about the sort of evidence in Evanston and Staples/Office
22 Depot as part of direct evidence. We had Litigator
23 Parker here talk about how it's really everything you're
24 going to persuade a federal judge with. This is a vast
25 topic.

1 And what I want to suggest in linking that vast
2 topic to practical revisions to the guidelines and
3 something that's going to persuade generalist judges,
4 which I think is a very important point here, that the
5 agencies should proceed with some caution.

6 With that said, let's talk about how direct
7 evidence can be relevant to merger analysis generally,
8 and I approach this in part as a litigator and counselor,
9 in part as a poor part-time academic. But, nonetheless,
10 this is how I'm approaching it.

11 It's uncontroversial, direct evidence, putting
12 aside market definition and the structural presumption
13 can make a case for a merger being illegal. The Supreme
14 Court has said that market share and market definition
15 are mere surrogates for anti-competitive effects for
16 Section 1, a little weaker proposition along those lines
17 for Section 2. We've had no other authority than Judge
18 Posner tell us that the tests substantively under Section
19 1 of the Sherman Act and Section 7 have converged. That
20 being the case, why can't direct evidence, one asks,
21 create a presumption itself of illegality in certain
22 circumstances in place potentially of an analysis of
23 market share and concentration. That's sort of a
24 starting point.

25 And then one thinks about the different types

1 of settings where that could arise. The most obvious
2 analogy for that, I believe, is a case like Evanston
3 where you have a consummated merger and there's where the
4 analogy to what the Supreme Court said in Indiana
5 Federation of Dentists about market share and market
6 power being mere proxies is more powerful. You have
7 conduct. You're trying to look at its actual past
8 effects.

9 What would be the more logical thing to ask
10 than what the merger did? Assuming you can create a
11 persuasive case of showing what it did. An important
12 question of proof. Parker has talked about how you might
13 play that out in a court. It wouldn't just be some fancy
14 econometric analysis isolating all the variables except
15 the change in number of players. But intuitively, at
16 least, a consummated merger is where the idea of using
17 direct evidence in lieu of the structural presumption is
18 most powerful.

19 And then the question is, how you deal with the
20 diversity of evidence. Trickier. And I think this is
21 the real key question for revising the merger guidelines,
22 is what one does in the case of unconsummated mergers.
23 And here's the \$64,000 question I submit, it's not where
24 direct evidence can be relevant, but where it tentatively
25 can be dispositive.

1 You can think about how day-to-day direct
2 evidence is used by the agencies in analyzing mergers.
3 One way that certainly fits within the more general
4 inherited legal landscape we have in Section 7 is
5 exculpatory direct evidence.

6 In a unilateral case, the parties are not close
7 competitors. There's been a history of entry. In a
8 coordinated case, the nature of the products, marketing,
9 pricing, et cetera, is such that coordination is just
10 implausible. You can see how from a law enforcement
11 perspective of trying to decide which mergers one is
12 going to take into a second request or even to court,
13 exculpatory direct evidence is clearly important and
14 something that the merger guidelines should, I think,
15 discuss how it is being used.

16 The question of what granular level to do it,
17 given the diversity, is a question I'll leave for the
18 discussion. So, that's the exculpatory side.

19 I think the hardest question at all -- and I'll
20 be brief so we can get to Professor Willig and leave
21 plenty of time for discussions -- is when direct evidence
22 can be inculpatory, and not just that, can itself
23 substitute for the structural presumption and basically
24 create a prima facie case of illegality by itself.

25 Of course, there have been noted efforts to

1 suggest frameworks for doing that. Of course, the
2 Director of the Bureau of Economics at the FTC and the
3 current and one-time again Deputy Assistant Attorney
4 General for Economics have proposed such a test. What I
5 want to suggest here is that one should proceed with
6 caution in suggesting and revising the guidelines, that
7 direct evidence, by itself, can carry today in the sort
8 of simple level that I think Judge Ginsburg laudably says
9 we would like to have in litigation.

10 The reason for that is that it's not clear to
11 me at all that the simple test of direct evidence is
12 inculpatory or going to tell enough of the story to be
13 persuasive to the courts. The courts have inherited a
14 legal landscape that says we want to look at what the
15 definition of the market is, not just because the Supreme
16 Court in Philadelphia National Bank told us it's useful,
17 but there's an intuition behind that. We want to know
18 more about that -- more than just the relationship
19 between these particular parties. We want to know what's
20 likely to happen with repositioning. We want to have an
21 intuitive sense for how much price might rise to the
22 extent you're saying look at just these insiders. We
23 want to look at a lot of things.

24 And I think if you say there's a simple
25 category of direct evidence that's going to be a

1 humdinger, that's enough to establish illegality, whether
2 it's the price increase in Staples, which I think,
3 interestingly enough, was cleverly used by the government
4 to establish the relevant market, or some of the tests
5 for unilateral effects that are going to be proposed,
6 you're risking three dangerous things.

7 One is you're going to risk having a method for
8 how the agencies operate that's out of step potentially
9 with what generalist judges will accept. And I know that
10 was a subject of earlier panels today. I'm sure it will
11 be a subject of later panels. I think there's a danger
12 of an intra-agency analysis that is not going to be
13 persuasive to the courts. It may be a few transactions
14 to get there, but, of course, those decisions that get
15 written are influential. It creates the incentives by
16 which the parties act and the agency acts in the merger
17 review process. It's important.

18 The second, if these tests for direct evidence
19 are relatively weak, it's enough to have evidence like
20 Staples/Office Depot, it's enough to have diversion ratio
21 times margins, that's enough, rebut it. I think you're
22 going to be potentially risking some false positives that
23 might outweigh false negatives. I suggest that might be
24 a possibility.

25 And if you believe that in that you're

1 basically saying, okay, we can split the burden, the
2 parties now have to rebut something. Now that we've put
3 this simple test forward, I suggest that it might not be
4 good not just for merger enforcement but for the role
5 merger enforcement plays in the economy.

6 Finally, and this links back to the diversity
7 point, tests for establishing a prima facie case with
8 direct evidence we might want to be simple, but the
9 rebuttal is going to be diverse, the point I started
10 with, and complex.

11 So, I think the challenge in revising the
12 guidelines is to mediate between those positions. Add
13 clarity potentially to the factors to go into this great
14 space of what do you do beyond a structural presumption,
15 but recognize that a simple answer may not always be
16 there. And although the Supreme Court in Sylvania said
17 that antitrust divorced from economic principles were the
18 last sound moorings, we should also remember that
19 antitrust is part of the legal system where parties must
20 be able to predict their conduct and we must have
21 transparency and a rule of law as well.

22 Thanks.

23 COMMISSIONER KOVACIC: Thanks, Mark. You and
24 Rich, again, drawing on your experience from both sides
25 of the enforcement process have done a nice job here, I

1 think, of laying out the menu of possibilities, different
2 types of proof that can be brought to bear and we can
3 come back on that in a moment.

4 Bobby, please.

5 MR. WILLIG: Thank you. You know, direct proof
6 of competitive effects sounds so powerful. It sounds
7 like such a marvel. What a great thing to skip all this
8 nasty work that we always do under the guidelines or any
9 other analytic frame.

10 It's my bottom line view that direct evidence
11 is almost never a magic bullet that obviates the need to
12 do a real competitive effects analysis. Direct evidence
13 is not, and I've hardly ever seen it be, a bypass of
14 competitive effects analysis, but it can be a terrific
15 and powerful source of data for a competitive effects
16 analysis.

17 I'm hedging my language here because Rich is on
18 the panel. I say almost never -- almost never due to the
19 occasional board document that Rich will have uncovered
20 in his old role, which asserts to the board that the
21 merger will enable prices to rise almost surely and
22 significantly due to the taming of our most powerful
23 competitor. And I know some of us seek those documents
24 and maybe that means, with a smoking gun in hand, there's
25 no need to do anything else. I'm not one to say that

1 that's not right or not occasionally the truth of the
2 case. But, more usually, there is no magic bullet.

3 Jim, you'll recall 20 years ago we were sitting
4 in the front office looking at the evidence, talking
5 about direct evidence. The merging parties were clearly
6 directly bidding against each other for the business of
7 their many customers. Directly bidding against each
8 other. It's one of the examples on the set-up list of
9 elements of direct evidence that maybe should be
10 incorporated in the new guidelines. The direct evidence
11 showed them directly bidding.

12 But still more direct evidence that you
13 instructed the staff to look for indicated that the
14 customers chose two or three rivals to go head-to-head
15 and bid directly against each other out of the five
16 players in the marketplace and the customers did not
17 really care very much which two or three they drew out of
18 the five in the marketplace. So, if the five became four
19 through a merger, there would be no diminution of
20 competition.

21 Direct evidence first said, oh, my god, they're
22 bidding against each other, stop all analysis. But under
23 the guidance of Mr. Rill -- I hope I'm not
24 mischaracterizing, too, my memory is rosy -- of course,
25 you get more direct evidence from a search in competitive

1 analysis showing that that first direct evidence would
2 have been misleading if it had been viewed as a magic
3 bullet.

4 On the other hand, I've seen firms making
5 commodities that were very close substitutes to each
6 other and they never bid against each other. We've
7 looked and looked and there's no evidence of them bidding
8 against each other. And you say, oh, magic bullet,
9 exculpatory. I think if we're going to change the
10 guidelines, we've got to keep that language out. What
11 does exculpatory mean?

12 MR. POPOFSKY: You had to look it up, Bobby,
13 you told me.

14 MR. WILLIG: I did and I sort of remember, but
15 I didn't see inculpatory in the other hand.

16 So, maybe that's exculpatory or something, but
17 a deeper analysis, a more complete analysis showed that
18 when one of those two firms that never bid against the
19 other had an output cutback, it raised prices in the
20 industry for everybody, including the other proposed
21 merging party. It's not necessarily about bidding
22 against each other. Sometimes it's about total output in
23 the market. Direct evidence without a competitive
24 analysis, full of pitfalls for the foolish looking for
25 magic bullets, I would say.

1 How about a proposed merger of retail category
2 superstores, not Office Depot/Staples, but some others
3 that I've encountered in my life as a consultant and an
4 analyst and a simple data analysis showed, absolutely,
5 prices are higher in areas where there are fewer of the
6 outlets of the big three chains in this marketplace. So,
7 higher prices correlated with fewer players among these
8 big superstore chains.

9 Is this a natural experiment which we all
10 crave? Does this prove competitive effects from a merger
11 that would shrink the three down to two in some areas or
12 the two down to one? Well, maybe in some circumstances,
13 yes, but only a fool would reach that conclusion without
14 a deeper competitive analysis. We ran those data in this
15 particular instance and we found that the company's own
16 guidelines for where to enter local markets keyed on
17 certain market factors, the desirability of the local
18 market. If the market stank from their point of view,
19 they weren't going in and, likewise, their rivals weren't
20 much either.

21 And those same competitive factors that made
22 entry stink also raised the cost of doing business on
23 average and intended to raise prices. So, a spurious
24 correlation between concentration and price which "direct
25 evidence," the marvelous natural experiments that we all

1 crave would have misled us into finding.

2

3 Of course, in Office Depot/Staples, the
4 evidence turned out to be right of that kind, not
5 econometrically, but because the smoking gun documents
6 showed that. Right, Rich?

7 So, I think it was that that ultimately
8 persuaded the court. The company said, yeah, we charge
9 higher prices when there's no competition around. It
10 wasn't the econometric standoff that led to the
11 conclusion.

12 MR. PARKER: I don't think the econometrics
13 have won any case in the world.

14 MR. WILLIG: Well, how about prosecutorial
15 decision-making? So, sometimes that direct evidence is
16 actually indicative and sometimes it's not.

17 I've looked at a situation where the
18 transaction cost had risen for futures contracts on LIBOR
19 interest rates. These are futures contracts on those
20 kinds of interest rates, whatever they are, I'll tell you
21 later. And when the transaction cost went up, volume
22 fell off. Sure enough, the data are collected daily,
23 hourly, minute-by-minute. It's easy to see tracks like
24 that in the data. But at the same time, when one looked
25 to see a corresponding volume rise on futures contracts

1 at another exchange, based on treasury bond interest
2 rates, there was no corresponding rise in volume there,
3 as volume fell off on the contracts on LIBOR interest
4 rate scored futures contracts. Evidently, no
5 substitution in the data.

6 Well, I think I'm with you about this
7 exculpatory stuff because sometimes the absence of a
8 finding of substitution actually requires less analysis
9 than the opposite finding where there could be all kinds
10 of confusing factors. And, so, we reached the
11 conclusion, and ultimately the merger went through, that
12 at least in this particular area of possible market
13 definition, there was no relevant market that included
14 both of those futures contracts and, therefore, no
15 competitive concerns.

16 MR. POPOFSKY: See, you used exculpatory
17 perfectly, Professor.

18 MR. WILLIG: I'm getting there. It's so good
19 being educated by you, Mark. Lawyers and economists
20 should be friends.

21 **(Laughter).**

22 MR. WILLIG: I've seen natural experiments
23 showing impact of market ups and downs on the demand side
24 leading the episodes of entry and exit. Definitely
25 providing all kinds of fruitful evidence about the

1 character and height of entry barriers, exit barriers,
2 the timing of entry, how long would it take for entry or
3 exit to react to changes in the market. But the
4 connection between entry and exit from evidence like
5 that, to the real issue of whether entry should alleviate
6 competitive concerns over a merger in that same space, as
7 we all know, would require deep competitive analysis.

8 The natural experiment is the beginning of the
9 evidence, it's not the end. It actually doesn't provide
10 the answer, but it provides enormously valuable evidence
11 for an ordinary competitive effects analysis.

12 So, with all of these examples, and there's
13 tons more that will be coming to your minds, I'm sure, I
14 come back to my conclusion. That direct evidence can aid
15 competitive analysis, it should be part of it, but it
16 can't supplant it. Direct evidence is often a provider
17 of central data and input into a true competitive
18 analysis of mergers.

19 So, those of you who are rewriting the
20 guidelines, please have the guidelines say this. There's
21 nothing like some good direct evidence to help inform a
22 proper competitive analysis. And the commentary that
23 goes along with the guidelines can have endless examples
24 of the kind that I was just recalling for the sake of
25 this presentation. Sometimes the examples say, yes,

1 direct evidence can be quite persuasive, and a lot of
2 examples say, caution, caution, you've got to go on and
3 ask further questions before you regard that direct
4 evidence as a magic bullet.

5 In other words, showing both the power of
6 direct evidence and the need for caution in interpreting
7 it should be part of, if not the guidelines, the
8 commentary, and that will bring the state of the art of
9 any such analysis along in a beneficial way. And I think
10 you can do that with part of this revision. But magic
11 bullet, no.

12 COMMISSIONER KOVACIC: Thanks, Bobby. And your
13 comments draw attention back, as all of you have, to what
14 specific kinds of approaches might be built into the
15 guidelines. I'd like to take one theme that all of you
16 have addressed and pose a question based on that.

17 In thinking of casting the guidelines, do you
18 think it is either wise or necessary to have at least
19 some attempt in the presentation of the case, to sketch
20 out what the boundaries, using a traditional approach of
21 a relevant market would be? To think of it another way,
22 can you imagine the time would come, or should come, when
23 you would see a complaint that would not include the
24 words "relevant market" or "market share" at all?

25 MR. PARKER: I can see a time when that is part

1 of a complaint, that is a theory in a complaint. But
2 somewhere you've got to have -- maybe in a different
3 count -- you got to have a market because that's what's
4 called for under the case law. Note that under the
5 Sherman Act, and I think this is an antitrust crowd, the
6 Republic Tobacco Case and Indiana Federation of Dentists
7 have started to talk about pulling away from actual
8 market analysis in the Sherman Act cases. And, it seems
9 to me, in some cases, nudging the courts in that
10 direction is not a bad idea and I think there's a lot to
11 it. But you got to nudge them.

12 Right now, you can't go into Federal Court or
13 Part 3, in my opinion, without defining the relevant
14 market. How important that becomes in the litigation, I
15 think I talked about previously.

16 MR. WILLIG: I would like to see relevant
17 market remain a critical part of the court case, I
18 suppose. But, to me, even more importantly, of the
19 discipline exercised by the agencies in making
20 enforcement decisions.

21 However, I would also like the agencies to
22 articulate publicly the current practice, which is to
23 make inferences about relevant market and delineations of
24 relevant market based on the best available evidence, and
25 that evidence may arise from the kinds of analyses that

1 we've been talking about or so-called direct evidence or
2 more inferentially from consumer interviews or from
3 marketing studies, whatever is the best evidence. An
4 assortment of lines of evidence, obviously, is
5 complementary, one part to the next. But still the
6 discipline should be part of the agency's review process
7 to articulate at the end of the day what is the inferred
8 but chosen definition of the relevant market.

9 MR. PARKER: Can I just make one point?

10 COMMISSIONER KOVACIC: Sure.

11 MR. PARKER: Somebody ought to go back and look
12 at the complaint that the agency filed -- and I wish
13 Molly Boast was still here because she was handling it --
14 in the BP/Amoco/Arco deal where we were saying that there
15 was a problem in Alaska, and I think we had two theories
16 there. One, there was a price discrimination market
17 involving sales to California refineries. But I also
18 think we had a count based simply on direct evidence that
19 one of the parties was already exercising monopoly power
20 there and that the party they were buying was the only
21 potential anecdote. I think that may actually have been
22 in that complaint because that's the theory we were going
23 to proceed on.

24 It was never tried because the transaction was
25 abandoned. But somebody ought to look at that in the

1 course of this because it goes directly to your point,
2 Bill.

3 COMMISSIONER KOVACIC: Doug?

4 JUDGE GINSBURG: It may be hard to imagine the
5 complaint that doesn't have it, but one can more readily
6 perhaps imagine the proceeding that doesn't get to it.

7 I think, Bill, Jim Rill will know, 35, 40 years
8 ago, didn't William Schwartzer write an article on the
9 efficiency sequencing of questions in trying an antitrust
10 case? I think people aren't familiar with it now because
11 what he said is so much the practice in terms of motions
12 to dismiss and summary judgment starting with basically
13 the least evidence intensive questions, although he
14 didn't put it quite that way.

15 So, I can imagine it being in the complaint,
16 but I can readily imagine cases in which that's just not
17 necessary to litigate it to death.

18 UNIDENTIFIED MALE: That's a good point.

19 COMMISSIONER KOVACIC: One debate that comes up
20 in the discussions about direct proof is that some have
21 said that it's a juris prudential prerequisite coming out
22 of the language of Section 7 of the Clayton Act, the
23 discussion of effects in a line of commerce, that it's
24 indispensable. Others have said that the courts
25 ultimately might be willing to import the approach that's

1 been developed in Section 1 and Section 2 cases that
2 suggest that certain types of direct proof of effects by
3 itself might be sufficient.

4 But I gather, in part, that what -- at least a
5 comment that's been mentioned a couple of times here is
6 that at least by way of providing a familiar frame of
7 reference for an approach to beginning to think about
8 actual likely effects, that some discussion of a relevant
9 market is a useful internal analytical discipline and a
10 good element of guidance and a good element of the
11 presentation of the case in court.

12 MR. POPOFSKY: Yes, I would agree with that
13 entirely.

14 JUDGE GINSBURG: Would you say that equally
15 with respect to the geographic market?

16 COMMISSIONER KOVACIC: I suppose that's a fair
17 question to pose in that --

18 JUDGE GINSBURG: I think it's a test of --

19 COMMISSIONER KOVACIC: Yes, yes.

20 JUDGE GINSBURG: You would?

21 COMMISSIONER KOVACIC: Yes.

22 MR. PARKER: I agree with that.

23 COMMISSIONER KOVACIC: Yes?

24 MR. PARKER: But what I was saying was that
25 that ought to be in the guidelines, that discipline to go

1 through. I think you can simply say it's not a gating
2 issue. You can simply say that it is probably more
3 important in some cases than in others, the market
4 analysis.

5 COMMISSIONER KOVACIC: One basic question is,
6 again, to think of who the audience for the guidelines is
7 and what their purpose is. Is it principally to reveal
8 the internal decision-making calculus of the agency and
9 its approach? And by making that evident, to enable
10 parties to come forward with arguments that will assist
11 in the assessment of the case? Are they designed on
12 their own terms to guide the courts towards the
13 acceptance of certain analytical techniques and
14 methodologies?

15 Is there ultimately expected to be what the
16 agencies will do inside the house and what they do in the
17 courtroom and that the guidelines might make clear that
18 there are certain things we are explaining to you for the
19 purpose of saying, here are analytical approaches we will
20 use on the inside, but we won't necessarily try cases
21 this way? We'll use another vocabulary, we'll use
22 another approach. We will welcome the more detailed
23 econometric analysis inside because we have the capacity
24 to do it, we have experience doing it and we welcome
25 that. But when it comes time to try the case, maybe in

1 the way that Rich was just saying, we won't do that.

2 There's the famous interview that Judge Hogan
3 gave after the Staples case in which he was asked in Ken
4 Auletta's book on Microsoft, how much did the
5 econometrics matter to you, and he said, not at all; that
6 is, I relied on the documentary evidence. Who is the
7 audience for this document? And is the document really
8 taking -- is it to take two approaches, one to say for
9 parties who come before us, this is evidence we'll use to
10 decide to prosecute, but when we go to actually proceed
11 to bring a case and lay it out, we won't necessarily use
12 the same techniques or methodologies that led us to
13 decide to go ahead.

14 MS. MARX: I mean, I view the guidelines as
15 giving some structure for how the agencies are going to
16 go about figuring out whether a particular -- a
17 quantification of whether a particular merger is going to
18 increase or decrease consumer surplus and whether it will
19 affect the nature of competition. Economists have a lot
20 to say about quantifying whether a merger might increase
21 or decrease consumer surplus, but essentially nothing to
22 say about proper legal strategy.

23 So, I could imagine a guidelines that were
24 geared toward analysis that's going to guide you toward
25 the correct policy decision and might be quite divorced

1 from what you would expect the agencies to go forward
2 with as their legal strategy.

3 MR. PARKER: Can I say one point about the
4 audience here? I don't overlook the client. You got
5 somebody who wants to do a billion dollar transaction and
6 cannot understand why he or she has to wait all this time
7 in Washington. As counsel, it is really helpful to -- I
8 mean, I always tell them, I say, look, we may disagree
9 with how the agency comes out, but I always say, these
10 are good people who know what they're doing. For
11 example, take home the merger guidelines and you will see
12 exactly what they're going to look at and you will see
13 that it makes sense.

14 So, I think that a document that lays out what
15 you're going to do in terms and that holds together and
16 is coherent actually is very good for the agency's role
17 in the broader economy and, most certainly, helps outside
18 counsel who are trying to explain why it is they can't
19 close their deal for ten months and they may have to go
20 to court to do it or whatever.

21 I just think the business community -- you
22 know, it's important to communicate that you folks know
23 what you're doing. You do know what you're doing, but
24 it's important to communicate that. I think the merger
25 guidelines are one way to do that, in my opinion.

1 MR. POPOFSKY: Let me pile onto that for just a
2 second.

3 COMMISSIONER KOVACIC: Mark and then Bobby.

4 MR. POPOFSKY: Because I could not disagree
5 more strongly with Professor Marx here. You know, I
6 don't think anyone said it better than Judge Breyer in
7 Barry Wright and again in his Leegin dissent. Antitrust
8 is not a mere applied economic exercise. It is a system
9 of law enforcement. It is something that very much, as
10 Rich said, affects businesses in the real world. And the
11 weaker the link between the methodology the guidelines
12 lay out and the principles that are applied in court and
13 the principles by which primary actors, you know, are
14 guided in their conduct, I think the more disastrous it
15 is. The link should be tight and it should be strong.

16 COMMISSIONER KOVACIC: Bobby?

17 MR. WILLIG: Defend yourself, Leslie.

18 MS. MARX: No, my point is that the type of
19 procedures that you would expect an agency to go at in
20 evaluating the effects of a merger are not necessarily in
21 the order or of the presentation you would want to make
22 in a legal case.

23 MR. POPOFSKY: I'm making even a deeper point,
24 I guess than that. I don't think that what the agency
25 should do should be a mere applied economic exercise to

1 calculate consumer surplus. I think, as Professor Willig
2 said, it's a competitive effects analysis. As Jonathon
3 Baker once wonderfully wrote, when a piano drops on a
4 sidewalk and hits someone, you don't ask was there
5 negligence, you ask who was negligent. You know, in
6 going through everything we do as a disciplining matter,
7 you know, market definition, calculating shares, all the
8 things the guidelines lay out as a way of thinking about
9 is wonderful for that because it structures the analysis
10 of deciding who dropped the piano.

11 But I think when you get farther away from that
12 and say, you know, let's engage in some mathematical
13 modeling exercise of how the piano got dropped, I think
14 there's a danger in many respects. It's just where I
15 come from on this.

16 MR. WILLIG: Okay, let's imagine a common sort
17 of thing, assume a can opener. Let's imagine an agency
18 whose leadership is really integrated and works well as a
19 team, and I think this is sometimes a reasonable
20 approximation of reality, not always to be sure. So, the
21 agency --

22 COMMISSIONER KOVACIC: It's been known to
23 happen.

24 MR. WILLIG: So, the agency decides to bring a
25 case against the merger and suppose that the econometric

1 analysis, call it that or call it the piano tuning if you
2 like, but the deeper analysis, call it econometrics, was
3 actually necessary for the agency to make up its
4 collective mind. Now, I'm not in an environment where
5 the lawyers say, oh, that's crap, and the economists say,
6 you're full of crap, not that sort of agency, but where
7 the parties -- the leadership actually listen to one
8 another.

9 Judge, you mentioned the airlines case, the
10 alliance situation. That may be a situation where
11 there's obviously competing considerations and maybe we
12 actually do need to look at the data to find out whether
13 the efficiencies or the anti-competitive effects are
14 stronger. Maybe. And maybe those econometrics that you
15 saw weren't really the right ones. I'll send you some
16 that are different.

17 **(Laughter).**

18 MR. WILLIG: So, the agency decides to bring
19 the case. The econometrics were crucial to the agency's
20 decision. That won't always be the case. Sometimes it
21 just amuses the economists. Sometimes it tends to lead
22 to a search for evidence that will be persuasive to
23 everybody, covering the same ground, but is not
24 econometric. And maybe that was the case in Staples/
25 Office Depot, I don't know. But imagine the econometrics

1 were really salient to the agency. Now, are you all
2 really saying that when you go to court, you shouldn't
3 use those econometrics because you're going to run into a
4 well informed other side that will rebut all of your
5 evidence, and the same way that the agency wasn't
6 persuaded, why should the court be persuaded unless the
7 trump card of the econometrics is played in an
8 understandable way in court? I just don't get it.

9 MR. POPOFSKY: Well, I certainly wasn't
10 advancing that proposition. I can't say it any better
11 than Brother Parker. It's confirmatory, it's consistent
12 with, it's a piece of the whole analysis.

13 MR. WILLIG: You're saying it's not needed.

14 MR. POPOFSKY: I'm not -- it may not be needed.

15 MR. WILLIG: Okay. But what if it is needed?

16 MR. POPOFSKY: You were posing a hypothetical
17 where for a decision to be made, it was needed.

18 MR. WILLIG: Yes, exactly. That's the catch.

19 MR. POPOFSKY: You know, and that is how the
20 decision maker was acting.

21 MR. WILLIG: So, what do you do with that case,
22 sir?

23 MR. POPOFSKY: What you do with that case is
24 it's important and it's a tipping factor, sure. What I
25 don't --

1 MR. WILLIG: Then do you show it in court?

2 MR. POPOFSKY: I don't think you would bring a
3 merger case without my Bobby Willig by my side, putting
4 up my calculations, my data, my equations. I would be
5 negligent to my client.

6 MR. WILLIG: And we'll beat the pants off the
7 other side, believe me.

8 MR. POPOFSKY: We would.

9 MR. WILLIG: Okay.

10 MR. PARKER: This is getting good, guys.

11 MR. WILLIG: As long as we have it on the
12 record, we're fine.

13 MR. POPOFSKY: What I object to is the notion
14 that merger analysis is a quest for econometric truth.

15 MR. WILLIG: Yes.

16 MR. POPOFSKY: That is what I was objecting to.

17 MR. WILLIG: That's true.

18 MS. MARX: Certainly, my proposition is that
19 it is a quest for the truth, and if the truth comes to us
20 in a board memo, that's one thing. But I think we need
21 to -- the whole nature of what we're worried about here
22 are competitive effects in mergers. That's economics.
23 That's how the market is going to be affected by the
24 merger. We need to be looking at economic evidence. I
25 think the economic evidence ought to be primary in these

1 cases.

2 Maybe once in the presentation of the legal
3 case, maybe it's easier for your audience to understand a
4 board memo, but I think the fundamental quest of the
5 agencies should be the economic truth.

6 COMMISSIONER KOVACIC: Doug?

7 JUDGE GINSBURG: Well, I just want to point out
8 that this whole discussion takes place in the context for
9 which we've convened, of thinking about merger cases.
10 So, there's no occasion in any imaginable merger case for
11 worrying about direct evidence as an economizing device,
12 all right? So, it's not like a Polygram situation.

13 The government's going to bring this case
14 that's going to use whatever resources it has. It's
15 worth challenging, it's worth defending. It's not
16 something where economizing on the proceedings is an
17 important value. However, the handling of direct
18 evidence may well spill over into private non-merger
19 cases. So, it's a concern that ought to be in the
20 background as revision goes forward.

21 There have been two articles in the last year,
22 one by Professor Stuckey's that's been published,
23 questioning or arguing that merger law in the United
24 States does not meet rule of law standards because of
25 problems of predictability and transparency. There's a

1 more recent manuscript, I think on SSRN that has not yet
2 been published, very recent, taking a similar view of the
3 law of the European Commission on mergers.

4 I think that is an important concern. If that
5 becomes a widespread perspective, I think it's very
6 deleterious to the agencies and, to a lesser degree, the
7 world of law itself.

8 So, I think the answer to the question I think
9 you posed at one point, Bill, about whether the
10 guidelines should reflect whatever they can about the
11 agencies' internal process has to be yes, even if it
12 doesn't always carry over into the presentation of
13 evidence.

14 MR. PARKER: There's a sense of which -- I
15 mean, that is extremely important. Just think about it,
16 folks. I mean, I don't do just mergers. I mean, I'm
17 spending most of my time right now trying to figure out
18 whether prices were fixed at a meeting that occurred
19 three years ago in a certain place at a time. You're in
20 a merger case, you're not doing that. You're trying to
21 figure out what's going to happen in the future.

22 So, I can't think of any other kind of case
23 that I've ever been involved in, maybe there is somewhere
24 in the law where you're trying to predict the future and
25 nobody really knows. What I'm suggesting -- I'm not

1 suggesting you just look at board memos or anything else.
2 I'm suggesting that things from the past like that,
3 natural experience, other kinds of things, are really
4 going to be the most persuasive. That does not mean that
5 the agency goes to court without doing the econometrics
6 or doing the best it possibly can given the current
7 economic capabilities of the day. You do both.

8 MR. POPOFSKY: Just one further comment on
9 that. I think mergers is actually an area where the
10 agencies have a particular responsibility to think about
11 the link between how they are approaching transactions
12 and what the legal principles are. Putting aside the
13 sequencing issues, I know another panel will probably
14 address whether one starts with, as I said, maybe
15 exculpatory evidence or very inculpatory evidence. I'm
16 not talking about sequencing. I'm talking about the
17 ultimate analysis.

18 And the reason for that is the reality that
19 very few cases, of course, get to Judge Ginsburg. It's
20 rare they go to District Court. It's even rarer they go
21 to the Court of Appeals. And it's, of course, not been
22 since General Dynamics or Citizens, whichever you want to
23 believe is really a merger case, that they've been the
24 Supreme Court. It's an area, given the realities of both
25 business, how the legal system works and other factors,

1 that the agencies really are acting in a law enforcement
2 role where, in some sense, they're both judge and jury,
3 and I think that creates a special responsibility for
4 that type market.

5 COMMISSIONER KOVACIC: We're just about the end
6 of the session and to close up, I wondered if I could go
7 back to the panelists, if you had a thought that you'd
8 like to close with for a minute or so. Why don't we pick
9 something maybe that you haven't drawn on or another
10 point you want to drive home. And maybe we'll start with
11 Bobby and come back this way.

12 MR. WILLIG: Thank you. One question mark in
13 my mind, and I call it a question mark, but I think I
14 have a leaning, is in view of the plethora of kinds of
15 direct evidence, and I agree with all of us when we make
16 the point that there's tons of different kinds, when we
17 think about different kinds of analytics that are
18 necessary to handle different kinds of direct evidence to
19 test their salience and their veracity, whether their
20 superficial look is actually sufficient to be taken
21 seriously, should we really put all that stuff in the
22 guidelines?

23 Because, in a way, we're worried about
24 checklists on the coordinated side. This will be an
25 infinitely long checklist of different kinds of direct

1 evidence and ways to test different kinds of direct
2 evidence. What a burden for the reader, for the user of
3 the guidelines, as opposed to having laundry lists like
4 that and examples off in the commentary and keeping just
5 the principles in the guidelines, to which we hope direct
6 evidence may go once that direct evidence is properly
7 tested through the analytics.

8 It's a question, but I think I know my answer
9 to it, yeah.

10 MS. MARX: One of the other things that was
11 raised in some of the questions for comments is whether
12 the presence of buyers with significant market power
13 should be viewed as something that might deter fears
14 about coordinated effects in a merger. I would want to
15 be cautious about putting something like that into the
16 merger guidelines because there are a number of examples
17 like in vitamin C where Coca Cola was an important buyer
18 of vitamin C and the cartel, although that made them pay
19 attention, they had to have special meetings to deal with
20 Coca Cola, the presence of the buyer -- the significant
21 buyer there did not deter the cartel.

22 In food flavor enhancers, -- that's a cartel
23 where there were four cartel members and only three large
24 buyers in Europe -- it's a problem for the cartel to
25 divide up those buyers, but they used counter-purchasing

1 agreements and managed to work things out where cartel
2 members would buy a requirement from each other.

3 So, I would be cautious about including
4 language in the guidelines that suggests that significant
5 buyers necessarily reduce the threat of coordinated
6 effects.

7 COMMISSIONER KOVACIC: Thanks, Leslie. Mark?

8 MR. POPOFSKY: Since Bobby spoke and it's safe
9 to speak, but I'm going to echo his theme. You know,
10 there's a tension between what businesses would like,
11 which is something of a checklist -- I mean, how many
12 clients, Rich, come to you and me and say, we'd like to
13 know can we do this, can we not do this, show us where
14 they say can we do this or not. On the other hand,
15 there's virtues in being modest, virtues in keeping one's
16 options open.

17 I suggest in this quest for finding nice, neat
18 answers that help make the law predictable in the merger
19 area, in finding potential substitutes for the
20 Philadelphia National Bank presumption, that the agencies
21 be relatively modest and recognize there's a lot that one
22 still doesn't know. And then when one is using direct
23 evidence as a surrogate for that, there's a lot of
24 trouble one can get into if one wants to basically flip
25 the burden to the other side.

1 COMMISSIONER KOVACIC: Rich?

2 MR. PARKER: Those of you who know me as
3 somebody who talks often and a lot are going to be
4 surprised, but I think I've already said what I think. I
5 hope it was clear and unambiguous and I most certainly
6 hope it was helpful.

7 JUDGE GINSBURG: Just following up on Professor
8 Willig's last observation, principles only in the
9 guidelines, illustration, checklists and so on on the
10 commentary, that's probably a good organizing principle.
11 I'm not sure of a practical difference it makes because I
12 don't -- unless things have changed, the commentary isn't
13 amended any more frequently than the guidelines. Has
14 that changed?

15 COMMISSIONER KOVACIC: The commentaries were
16 the first of the type.

17 JUDGE GINSBURG: Okay.

18 COMMISSIONER KOVACIC: So, they were sometimes
19 called guidelines on the guidelines.

20 JUDGE GINSBURG: I think it's worth -- this is
21 a perennial, but I hope you might find occasion to
22 revisit it at the agencies in connection with this
23 project, and that is doing something more by way of
24 closing statements when cases are not brought, that would
25 supplement the guidelines in a meaningful way. And

1 something that can be very brief and suggestive rather
2 than detailed and then, certainly, you have to be
3 concerned with trade secrets and so on. But that would
4 give some ongoing guidance.

5 In my far outdated experience, every potential
6 merger case involved a story or two stories and parties
7 came in and told us their story and the staff came in and
8 told us why that story was not right or why, in fact, it
9 checked out later on. And a lot of those stories are
10 totally unique, but like common law cases, the cumulation
11 of unique cases enables people to triangulate their
12 position and to steer accordingly.

13 COMMISSIONER KOVACIC: I want to thank everyone
14 for addressing what will be a fundamental focus of
15 concern for the revision process as it takes place.
16 There is, again, a traditional framework that everyone is
17 familiar with. If you plug in the relevant language, you
18 get the countless number of cases that begin by saying we
19 always begin the Section 7 case inevitably by defining a
20 relevant market, measuring market shares and going on
21 from there. Yet, there's been another literature body of
22 experience that says, in a number of instances, that's
23 not strictly necessary and it can even be a source of
24 confusion.

25 I think today there's been an excellent

1 discussion of how those two views might be reconciled in
2 a new drafting effort here. I'm grateful for all of you
3 helping us see theory meet practice in talking about the
4 topic. Let me ask you to thank our panel.

5 **(Applause.)**

6 COMMISSIONER KOVACIC: And I think the Panel 3
7 on market definition starts at 2:00.

8 **(Panel 2 concluded.)**

9 **(Luncheon recess taken.)**

1 **PANEL THREE: MARKET DEFINITION**

2 MR. FEINSTEIN: Why don't we get started with
3 the next session. For those of you who don't know me,
4 I'm Rich Feinstein. I'm privileged to serve as the
5 Director of the Bureau of Competition. One thing that
6 I've already learned just from coming up to this table is
7 that the Bureau of Competition has these very cool pens,
8 which I didn't know about until this morning. So, I will
9 have gotten something out of today.

10 In any event, the first two panels this
11 morning, I think, set the bar pretty high. But we have a
12 very distinguished group which we hope will not
13 disappoint the afternoon audience. I don't think we
14 will. We've got an interesting topic, which is market
15 definition. And the way we're going to organize this is
16 pretty much the same as it was done this morning, which
17 is to say that I've asked each of the participants in the
18 panel to make an opening statement of five to ten
19 minutes, and I will enforce that. And after that, we
20 will be kicking around some questions.

21 If any members of the audience have questions,
22 the same rules apply. Please write them down on a card
23 and get them up to me and then we will see if we can get
24 into those.

25 I also want to mention that Larry White has

1 brought a handout. There are copies of it, I believe, on
2 the table in the back of the room, as well as on the
3 table in the hallway outside the room. It's a one-page
4 outline.

5 MR. WHITE: A one-page outline that you'll be
6 hearing.

7 MR. FEINSTEIN: So, let me just very briefly
8 introduce our four speakers and then we'll get started.

9 To my immediate left is Eduardo Perez Motta,
10 and we are very, very pleased to have him with us today.
11 He, since 2004, has served as the Chairman of Mexico's
12 Federal Commission on Competition. We're honored to have
13 him participating in today's workshop. Eduardo has a
14 long and distinguished career in public service in Mexico
15 and also has a background in economics and we're looking
16 forward to hearing his remarks today.

17 To Eduardo's left is Jonathan Baker who is well
18 known to many people in this room, I'm sure. He is
19 currently a Professor at American University's Washington
20 College of Law and was formerly a Director of the Bureau
21 of Economics at the FTC.

22 To Jonathan's left is Larry White who is
23 currently a Professor of Economics at the Stern School of
24 Business at NYU where he's also the Deputy Chair of the
25 Economics Department, and Larry served as the Director of

1 what was then known as the Economic Policy Office in the
2 Antitrust Division back in the early eighties when I was
3 actually working there as a staff attorney and assistant
4 section chief. And we're delighted to have Larry here.

5 And then I'm not sure Joe has ever been to the
6 left of anyone, but at the far end of this table is Joe
7 Simons who is well known to many people here. Joe, of
8 course, served as the Director of the Bureau of
9 Competition from 2001 to 2003, is a very accomplished
10 antitrust counselor and litigator, and is currently the
11 co-Chair of the Antitrust Group at Paul, Weiss.

12 So, with that, let's begin the presentations
13 and we'll begin with Eduardo.

14 MR. PEREZ MOTTA: Well, thank you very much.
15 It is a privilege for me to be here with you in this
16 discussion. Let me start by saying that I find this --
17 the idea to organize these hearings as something quite
18 positive and this is something that we should do, frankly
19 speaking, we should do in Mexico as soon as possible.

20 The Mexican law specifies and the rulings
21 specify how we have to do this, but it's always quite
22 useful to put an outline or guidelines publicly so that
23 all the operators and the -- the economic operators or
24 economic agents and lawyers and economists can understand
25 what's the methodology, the methodology that is used by

1 the authority to take these decisions.

2 So, first of all, I think it's a very good idea
3 to have these guidelines. I know that your guidelines
4 come from 1992. There -- more recent commentary on the
5 guidelines, but I think it's always a good idea to have a
6 check and to have this review publicly in these kind of
7 hearings. I think it's a good idea.

8 So, let me thank you for inviting me and also
9 recognize that this is a very important exercise, and
10 this is an exercise that we are going to -- actually, we
11 are going to follow very soon in Mexico.

12 This topic, the topic that we are discussing in
13 this panel, is market definition. From the years that I
14 have been in the competition authority in Mexico, I
15 frankly find that this might be one of the most
16 contentious and maybe one of the most difficult issues
17 always. What's the relevant market? How do you define
18 the relevant market? This is a major issue and it goes
19 not only for mergers, but also for investigations on
20 abuse of dominance. So, I think this is a major problem
21 and it's always important to give a discussion on this
22 concept.

23 I'm going to use less than my ten minutes. Let
24 me explain to you, very briefly, how we work on merger
25 analysis and what's the basic element that we use in

1 Mexico, according to our law and our rulings. Our law is
2 -- let's put it this way, the Competition Commission, the
3 Mexican Competition Commission, the Federal Competition
4 Commission is basically empowered by the federal law of
5 economic competition and also has its regulations that
6 are the ones that allow us to challenge something and to
7 impose sanctions on any merger whose aim or effect --
8 this is the important point -- the aim or effect is to
9 reduce, lessen or prevent competition and free market
10 access to products and services that are equal, similar
11 or substantially related. This is exactly what the law
12 says.

13 So, the competition is going to sanction those
14 measures that lessen, harm or impede competition
15 basically when they approach one of these three elements.
16 We consider that they lessen or harm or impede
17 competition when they first confer the ability -- the
18 ability to the company or to the companies that is going
19 to come out from the merger to unilaterally set prices.
20 That is the first point, the first element.

21 The second is to unduly displace or restrict
22 access to competitors or the third element, which is to
23 facilitate anti-competitive conduct and anti-competitive
24 conduct could be either a collusion or a unilateral anti-
25 competitive conduct. So, those are the elements that

1 could allow us to sanction a merger.

2 Now, the elements that we consider for a merger
3 analysis are basically five elements. The first is the
4 definition of the relevant market. That's the main
5 issue. The second is the market concentration and the
6 market power which is basically the market share or the
7 ability to set prices, to restrict input by (inaudible),
8 position, conduct, access to inputs and imports. So, in
9 this case, what we basically use is the Herfindahl-
10 Hirschman Index and another index that we have developed
11 that we call the dominance index. We have published in
12 the Official Gazette basically how we handle those
13 measures and this is information that is very public.

14 The third element is the merger effect on
15 competitors, clients, related markets or agents. The
16 fourth element is basically cross ownership. And the
17 fifth and last element is something that was introduced
18 recently in the reform of the law three years ago, is an
19 efficiency defense. So, the companies that are notifying
20 a merger basically have to or they can justify, on
21 efficiency grounds, the impact that this merger is going
22 to have.

23 So, this is basically our legal framework.
24 That's how we make these analysis. And I would like to
25 stop here just to start this discussion. Thank you very

1 much, Richard.

2 MR. FEINSTEIN: Jonathan?

3 MR. BAKER: Thank you. I want to thank Rich
4 and Carl for inviting me, and I'm delighted to be back to
5 the FTC. And I think I probably ought to add that, you
6 didn't put it in your introduction, but I'm actually
7 right now at the Federal Communications Commission, but
8 I'm not speaking for them, just for me.

9 I have two points I'd like to make about market
10 definition. The first is that market definition is more
11 important for analyzing coordinated effects than for
12 unilateral effects. So, let me explain that first and
13 then I'll go on to my second point.

14 In a coordinated effects case, the key question
15 is whether the merger changes the nature of the rivalry
16 among the firms. Now, we need to define the market in
17 order to figure out what firms to think about. Who are
18 the market participants? And we also need to define the
19 market to compute market shares, which we might want to
20 use to determine how market concentration changes or if
21 we're not going to use that route for identifying
22 coordinated effects, we still might want to know market
23 shares perhaps to identify who the maverick is. So, the
24 reasons and the nature of the coordinated effects
25 analysis that would lead us to want to define the market.

1 In a unilateral effects case -- and here I'm
2 going to talk about unilateral effects involving
3 localized competition among sellers of differentiated
4 products, which is the most common setting -- the key
5 question is different. The key question is whether a
6 substantial fraction of the customers of one of the
7 merging firms views a product of the other firm as their
8 second choice. And unilateral affects cases, in other
9 words, turn most importantly on the nature of the buyer
10 substitution between the products of the merging firms,
11 not on the way sellers interact.

12 Now, you know, it's not that you wouldn't get
13 into how sellers interact. But the key initial core
14 question has to do with buyer substitution and, in
15 particular, buyer second choices from the buyers of one
16 product, what their second choice is and whether it's the
17 product of the merging firm, the partner -- the merging
18 firm's partner. Market shares and market concentration
19 often contain very little information about buyer's
20 second choices. So, they don't help much in identifying
21 unilateral effects.

22 There's other kinds of evidence that might be
23 more probative, you know, for example, how price varies
24 with market structure, like we did in Staples, or
25 diversion ratios or other things that one would want to

1 look at that would be more probative than market shares.

2 And, also, it may be hard to determine market
3 shares reliably in differentiated product industries
4 where market boundaries can be difficult to draw, with a
5 densely packed space, that kind of thing.

6 So, that's my first point. Market definition
7 is more important for analyzing coordinated effects than
8 unilateral effects.

9 My second is that market definition needs to
10 focus on one economic force only, namely buyer
11 substitution. If you ask market definition to do too
12 much, it's easy to get confused. So, this is not quite
13 an economic proposition; this is a how to make it work in
14 practice proposition. And that's why the guidelines
15 don't ask this analytical step to account for supply
16 substitution as well as demand substitution or least why
17 it makes sense for them not to. In contrast, some courts
18 will account for supply substitution in defining markets
19 in -- at least in monopolization and other exclusionary
20 conduct cases.

21 And it's also why it's a bad idea to try to
22 account for the significance of demand complementarities,
23 including those associated with two-sided platforms,
24 which is, you know, a topical issue in the market
25 definition step of the analytical process. By all means,

1 we have to think about that and think about the
2 significance of complementarities in order to evaluate
3 the competitive effects of the merger, but let's do it in
4 the step of analyzing competitive effects, not market
5 definition.

6 In fact, if you think about the structure of
7 the merger guidelines, they sensibly allocate the
8 economic forces to different steps of the analysis. So,
9 buyer substitution analysis is what we're talking about,
10 but supply substitution is mainly handled in the entry
11 step, although there's also some aspects of it that are
12 taken into account in figuring out who the market
13 participants are. That would be the uncommitted entrants
14 and, in the context of unilateral effects, repositioning.
15 And the rivalry among sellers is addressed in the
16 competitive effects analysis and some other things are
17 addressed there as well.

18 Now, this allocation breaks down in unilateral
19 effects cases, though. Because the guidelines ask us to
20 analyze buyer substitution twice in a unilateral effects
21 case. First, in defining the market and then, once again
22 later, in determining diversion ratios or whatever we're
23 going to do in the competitive effects analysis.

24 Now, there are technical differences between
25 the two analyses. So, for example, if we thought that

1 the merged firm would raise price but not by as much as
2 the SSNIP, say only by 4 percent, we might catch the
3 problem in the competitive effects SSNIP, but not catch
4 it when defining the market. But, in general, it may
5 well make more sense to analyze buyer substitution only
6 once in unilateral effects cases. And if we're only
7 going to do that, I would do it in competitive analysis
8 rather than the market definition step. Thanks.

9 MR. FEINSTEIN: Thank you. And my apologies
10 for leaving out your current duties at the FCC in the
11 introduction.

12 MR. BAKER: Oh, that's fine.

13 MR. FEINSTEIN: Larry?

14 MR. WHITE: Okay. Again, my thanks to Rich and
15 Carl for inviting me and shepherding this whole
16 operation. I think it's a very, very valuable effort.

17 I do want to talk about the hypothetical
18 monopolist market definition paradigm. It has stood the
19 test of time. It's now been 27 years since 1982 when it
20 was first enunciated. And I think there are good reasons
21 why it has stood the test of time.

22 First, it's a conservative approach. It
23 basically asks, as a general matter, although there are
24 exceptions, what is the smallest group of producers that
25 if they colluded; i.e., acted as a hypothetical

1 monopolist, could succeed in exercising or enhancing
2 market power? Or equivalently, and this really goes to
3 the heart of the matter, a relevant market is, in
4 essence, one that can be monopolized. I think that's a
5 very useful framework, a useful just world view of
6 thinking, you know, what are we trying to find here?

7 And then, of course, the remainder of the
8 guidelines, as John just indicated, provide the means for
9 determining the likelihood that either market power will
10 arise initially or any existing market power could be
11 enhanced because of the structural and/or behavioral
12 characteristics of the market.

13 There's another very important aspect of the
14 paradigm, its flexible use. First, whether the
15 participants in the market are already exercising market
16 power is irrelevant. That hung up a lot of people for a
17 while, but it's irrelevant because the paradigm is
18 basically asking, could this merger make things worse?
19 And that's really the relevant question. Could this
20 merger make things worse?

21 Further, though the paradigm focuses on
22 producers, and properly so because it's producers that
23 might collude post-merger and, so, you want to be
24 focusing your attention on them. But in the case of
25 price discrimination markets, you've also got to identify

1 relevant consumers. And, so, there's that flexibility
2 there.

3 Further aspect of flexibility. The paradigm
4 was developed in the context of a world view that was
5 basically all about coordinated effects. In 1982, that's
6 the way the men and women of the Antitrust Division of
7 the U.S. Department of Justice thought about what were
8 the problems for mergers. It was a coordinated effects
9 view. However, the paradigm is applicable for unilateral
10 effects, has been used in these kinds of cases. But I
11 want to ask the question -- John has addressed it to some
12 extent, I'll address it in just a minute -- is it really
13 necessary for unilateral effects cases?

14 So, as I think about the strengths of the
15 paradigm, why it has stood the test of time, it's a
16 relatively conservative approach, and I think that's a
17 healthy approach. And it's got these nice aspects of
18 flexibility.

19 All right, what are the limitations? Well, now
20 I'm going to come back to the unilateral effects
21 analysis. As Joe Farrell's sharp eye noticed in my one-
22 page handout that's available, I screwed it up and
23 mistakenly wrote coordinated effects where I really meant
24 unilateral effects in this part of my outline.

25 The market definition -- I'm going to go more

1 strongly than John on this point -- I think it's
2 potentially confusing, a confusing afterthought in a
3 unilateral effects analysis. And if you want a good
4 example of that, I urge you to read Vaughn Walker's
5 decision in the Oracle case.

6 I have increasingly come around to the view
7 that basically says if you have found significant
8 unilateral effects, you've got a market. That's got to
9 be a market because you found something where there are
10 going to be post-merger significant price increases.
11 That's what we're concerned about. That's got to be a
12 market.

13 Now, how that gets phrased, I don't really
14 care. But you don't want the market definition confusing
15 the issue. You want it in unilateral effects cases
16 basically saying, you know, hey, we found the effect,
17 that must mean there is a market here.

18 The other thing I want to point out -- and this
19 is not strictly a merger guidelines issue, but I'm going
20 to be using the inspiration of Rahm Emanuel, as you know,
21 his maxim is never let a good crisis go to waste. Well,
22 never let a good opportunity go to waste.

23 And the other thing I want to mention about the
24 hypothetical monopolist market definition paradigm is
25 that its application to monopolization cases is severely

1 limited. It can only be used for prospective
2 monopolization actions. Every once in a while that may
3 come up, but that's not the typical monopolization case.
4 The typical monopolization case is where the defendant is
5 being accused of bad acts and an essential feature is to
6 argue that the defendant already has market power. And
7 if that's so, you cannot use the hypothetical
8 monopolization market definition paradigm, because trying
9 to use it in that context really is committing the
10 cellophane fallacy. So, let me stop there.

11 MR. FEINSTEIN: Thanks, Larry. Go ahead, Joe.

12 MR. SIMONS: All right. Thanks, Rich. Good
13 afternoon, everyone. I want to thank Rich for inviting
14 me and I guess Joe and Carl as well. You and your
15 colleagues are to be highly commended, I think, for
16 initiating this enterprise. I think no matter how it
17 comes out, it's going to be extremely beneficial to the
18 antitrust community.

19 So, let me start out by echoing some of the
20 things that Larry said and what some of the folks this
21 morning said as well, which is, that the existing
22 guidelines are very, very good, have very deep bipartisan
23 support and have clearly withstood the test of time. As
24 a result of that, my own view would be that I would be
25 very cautious in making major changes, and I think if it

1 were up to me, I'm not sure that I would change very much
2 at all.

3 But having said that, I'd like to cover four
4 points today, one kind of a general comment on the
5 guidelines and then three points about market definition.

6 On the overall point, as currently drafted, the
7 guidelines are very general in nature. They don't go
8 into a huge amount of detail trying to anticipate every
9 factual situation that might come up in a merger. And I
10 think that's the right approach. I think it would be a
11 mistake to inject a lot of detail into the guidelines
12 rather than having them focus on broad principles, which
13 Larry did a terrific job of laying out in terms of the
14 market definition.

15 So, my sense would be let's focus on the
16 broader principles and let's have the applications to the
17 specific facts flushed out over time through experience.
18 That flushing out process has been and can continue to be
19 made transparent to those outside the agencies through
20 speeches, closing statements, commentaries and the like.
21 I think the method of applying the guidelines has
22 developed very substantially over time in different ways
23 with respect to different parts of it, and I just think
24 it's not possible to account for every factual situation.
25 So, my sense would be to kind of stick with the broad

1 principles along the lines of the current form.

2 So, since our panel is discussing market
3 definition, let me try to make three points on that
4 score. First, something very basic, which is that I
5 think market definition needs to remain as a key part of
6 the analytic framework for the merger guidelines. The
7 statute and case law require it. And I think that, at
8 least my sense is certainly among the lawyers, getting
9 rid of the market definition in the guidelines would not
10 have a lot of support. I understand, you know, just from
11 talking to economists and certainly from what Larry and
12 John have said just moments ago, that that type of
13 approach is much more popular with the antitrust
14 economists. And, you know, I think you can understand
15 why.

16 A lot of that is based on -- the unilateral
17 effects analysis is based on economic modeling and
18 simulations. That's much easier for the economists to
19 get their arms around, much less so for the lawyers. I
20 think the lawyers are going to have some concern as to if
21 you really rely on that, how it's going to play out in
22 court.

23 I think there is one circumstance, in
24 particular, I think it's pretty rare, where you're going
25 to be able to prove direct effects of a merger, and in

1 that case, the market definition pretty much falls out of
2 your proof of direct effects. This is consistent with
3 what Larry was just saying. So, if you prove that the
4 merger caused the prices to go up -- an example of that
5 was FTC's case involving Evanston Hospital -- then pretty
6 much there has to be a market there someplace.

7 In fact, a kind of interesting sidelight, I was
8 at the Bureau when that case was being developed. And
9 the economics -- econometrics actually drove that
10 investigation because that showed that there was a price
11 effect. The intuition of the lawyers was, gee, it's kind
12 of hard to define a market here. You had geographic
13 issues. You had issues about one hospital was a
14 community hospital; one hospital was a teaching hospital.
15 And, so, there was a little bit of confusion about how
16 should they approach the market definition.

17 And what really drove that for the staff, I
18 think, and for me was the economics, showing that there
19 was an effect. So, if we knew there was an effect, then
20 there should be a market there. But I think that's a
21 pretty rare case and to kind of take the market
22 definition out of the guidelines based on that I think
23 would be a mistake.

24 Second, I'd like to address a couple of points
25 relating to critical loss and diversion analysis. I

1 would not recommend putting the details of how to do
2 critical loss into the merger guidelines. I think
3 critical loss or something like it is going to,
4 oftentimes, be necessary when you're defining a market
5 under the merger guidelines. So, unless the market is
6 really obvious and it doesn't take a brain surgeon or any
7 kind of serious analysis to figure out what the market
8 is, you're going to have to get some sense of how much
9 volume is necessary to make the price increase
10 unprofitable.

11 Now, you can do that through critical loss and
12 maybe there are other ways to do that, too. But one way
13 or another, you've got to get some sense of what that
14 number is, what the range is. Is it 10 or 20 percent?
15 Is it 70 or 80 percent? I think if you asked most folks
16 today, they would tell you it was kind of towards the
17 lower end. But if you went back 20 years before critical
18 loss was done in any kind of serious way, you look at the
19 NAAG merger guidelines, for example, who say the number
20 should be 75 percent. So, one way or another, you're
21 going to have to do that.

22 The details are going to vary depending on the
23 factual circumstances. I think if you try to put that
24 into the guidelines, you're going to create more problems
25 than you're solving. Similarly, I wouldn't want to put

1 anything in the guidelines that discussed estimating what
2 I refer to as the actual loss from the margin data via
3 the Lerner Index or the inverse elasticity rule, however
4 you want to characterize it. At least among lawyers and
5 I think some economists as well, this would be highly
6 controversial. As far as I'm aware, it hasn't been done
7 successfully in court. I think it's been tried a couple
8 times and not done very well.

9 And then the other thing is the necessary
10 implication of using the Lerner Index to underlie your
11 analysis is, at least from what I know, virtually all
12 horizontal mergers raise price and that is something that
13 I think the lawyers will have an issue with.

14 Regarding diversion analysis, I think that
15 that's something that is much more relevant for
16 unilateral effects, and really if you're going to discuss
17 it, it should be in the unilateral effects section. And
18 I don't really think that's really useful for the
19 guidelines and the market definition.

20 And the third point I wanted to make relates to
21 what type of SSNIP we should talk about or use in the
22 guidelines. Based on my own experience, talking to folks
23 at the FTC and talking to folks at the DOJ, I have never
24 seen -- and the folks I've talked to can only think of
25 once or twice -- where a merger was investigated using

1 something other than an across the board SSNIP. The
2 guidelines, as they're written currently, would allow a
3 market to be defined based on a SSNIP relating to just
4 one firm. So, you have five firms in the market, one
5 firm raises the price and you can define a SSNIP on that
6 basis. I think that's not done in practice. I think
7 it's misleading to do it that way and my recommendation
8 would be to take it out.

9 And then the final thought I have is just to
10 recommend adherence to the Hippocratic Oath, Rich, which
11 is particularly appropriate for him since he was head of
12 the health care shop. You've got a very well respected
13 set of guidelines here with a huge bipartisan consensus
14 behind them. And, so, in that circumstance, I think it
15 becomes really important, you know, above all else, do no
16 harm. Thanks.

17 MR. FEINSTEIN: Well, I think I can probably
18 speak for all six of us who are working diligently in
19 this effort that that is our goal, to do no harm. Thank
20 you very much, Joe.

21 What I'd like to do first, I guess, for those
22 of you who were here this morning, there was a very
23 lively debate, particularly I guess on the second panel,
24 relating to the use of direct evidence on anti-
25 competitive effects or competitive effects, not

1 necessarily anti-competitive effects. They touched, to
2 some degree, on how the availability of direct effects
3 might bear on market definition. What I'd like to do is
4 approach it from -- you know, sort of the same question
5 from a little bit different perspective.

6 And, Joe, you eluded to a circumstance where we
7 had a consummated merger and it appeared, based on the
8 econometrics, that the direct effects were fairly clear.
9 That may not always be the case. Even in a consummated
10 merger that may not always be the case. It's probably
11 even less likely to be the case directly, as opposed to
12 by analogy or by example, in an unconsummated merger
13 where you're trying to make a prediction.

14 So, the first question I'd like to solicit the
15 group's thinking on is, given the fact that the purpose
16 of market definition is to identify the context in which
17 likely or actual competitive effects are to be assessed,
18 are there circumstances where the existence of direct
19 evidence of competitive effects reduces the need for a
20 precise market definition? And if so, what are they and
21 should they be specifically addressed in the guidelines?

22 MR. WHITE: All right, I'll leap out. Yes,
23 yes, yes. I'll say it again, if you found direct effects
24 in a unilateral effects case, you have a market and you
25 don't need to go any further. Anything more risks

1 confusing Vaughn Walker. I guess that's -- I don't know
2 how to say it more directly. And so, I would just stop
3 there.

4 MR. FEINSTEIN: John, why don't you go. Since
5 Joe's had the floor more recently, let's give John a
6 chance.

7 MR. BAKER: That's fine. Although I'm going to
8 agree with Larry. Joe might come out the other way. So,
9 there are two different kinds of direct evidence that are
10 worth talking about. One is direct evidence of the
11 ultimate question of anti-competitive effects which I
12 think of as let's say a price market structure kind of
13 study like we did in Staples. But there's also direct
14 evidence of something from which you then infer that
15 there's harm to competition. Like, for example, direct
16 evidence about demand elasticities and diversion ratios
17 and things like that.

18 And if you are using market shares as the basis
19 for proving harm to competition, you are making an
20 inference, also. It's just based on market shares. So,
21 all kinds of evidence might be probative in different
22 kinds of settings. And there will be cases where the
23 direct evidence that the merger is going to raise price
24 is totally convincing and the other evidence won't help
25 you much. Even if it came out the other way, you

1 wouldn't believe it. And there will be cases where
2 you'll have some of the other kinds of evidence and the
3 market shares and market concentration will help you.
4 And so, in the first setting, you don't need to worry
5 about market definition as much. And I guess I talked
6 early about how that's more likely to be so in the
7 unilateral context than in the coordinated effects
8 context.

9 I do want to say something since Larry brought
10 up Vaughn Walker twice. I don't view that as a confused
11 judge. I think that Judge Walker knew exactly what he
12 was doing. He just didn't want to find unilateral
13 effects in that case. And to be honest, I think it would
14 be a mistake to rewrite the merger guidelines purely in
15 response to what Judge Walker had to say because he's
16 very different from most judges. He's an antitrust
17 expert who had a strong point of view is my take. And
18 most federal judges are not antitrust experts who are
19 trying to sell us on their perspective on unilateral
20 effects and merger analysis, and so wouldn't respond in
21 the same way as he did.

22 MR. FEINSTEIN: Joe?

23 MR. SIMONS: Right. So, following up on that
24 point from Jonathan, I couldn't agree more on the Vaughn
25 Walker point, which leads right into the point I was

1 going to make, which is that I think for most, at least
2 for me, a good case is one in which all the evidence
3 points in the same direction. And if it really is a good
4 case, the odds are good that the evidence is all going to
5 flow in that one way. So, even though you might have
6 evidence of a direct effect, I would want to look at the
7 other evidence as well. I think in terms of a judge, the
8 judge you're most likely to get in front of is not going
9 to be the Vaughn Walker type of judge. The judge you're
10 most likely to get in front of doesn't know anything
11 about antitrust. And the way to convince that judge is,
12 you know, the more stuff you've got going in the same
13 direction, the more likely you are to convince him.

14 MR. WHITE: I'd like to leap back in because
15 I've been really chewing on something that Joe said in
16 his earlier remarks and I think is relevant here. He
17 talked, at the very end, what type of SSNIP. And he
18 said, suppose you have a market with five firms but only
19 one firm raises its price. Am I --

20 MR. SIMONS: Yes.

21 MR. WHITE: Okay. I assume you're talking
22 post-merger.

23 MR. SIMONS: Yes, it was the hypothetical
24 monopolist controls the five firms and the hypothetical
25 monopolist only raises the price of firm one.

1 MR. WHITE: And I would say you've been led
2 astray by market definition that really -- if you've got
3 the one firm that's going to be able to raise its price,
4 you know, there is a market right there. And stop, don't
5 go any further. You're going to confuse somebody.

6 And so, think in terms of what's the goal here.
7 It's to prevent the raising of price either in a
8 coordinated manner, in which case market definition is
9 terrifically important, echoing what John said earlier.
10 Or unilaterally, in which case, stop, don't go any
11 further. You're going to confuse somebody.

12 MR. SIMONS: Can I follow up on that point?

13 MR. FEINSTEIN: Sure.

14 MR. SIMONS: So, I probably was not clear in
15 the example I was trying to -- at least I had in my mind.
16 So, here's what I had in my mind. If you think of a
17 situation where there are ten equally situated firms and
18 you have a merger of firms one and two and we assume for
19 the example that they can't raise the price of both their
20 products or either one of them. We further assume that
21 firms one through five, if they're monopolized, they
22 can't profitably impose an across the board SSNIP either.

23

24 But let's suppose we then assume that if the
25 hypothetical monopolist of firms one through five could

1 impose a profitable SSNIP by just raising the price of
2 firm one's product. And under the guidelines as
3 currently written, you could define a market that way,
4 except that wouldn't tell you very much. Because by
5 hypothetical, we've assumed that you can't have a
6 unilateral effect. The only way you can have a
7 coordinated effect, the only way that the compliant firm
8 raises price is to get a side payment from firms three,
9 four and five. So, if that's the only way can you have a
10 problem, then why are we looking at that? That's what I
11 had on my mind.

12 MR. BAKER: Well, there's sort of an answer to
13 that, which is maybe that you think -- well, you sort of
14 say side payment. What you're trying to do when you say
15 that is you want to rule out tacit collusion, too.

16 MR. SIMONS: No, no, no.

17 MR. BAKER: But in the market you describe, in
18 principle, there could be a coordinated effects problem.
19 Maybe this particular merger, you know, changed the
20 market structure in a way that made it possible for the
21 post-merger firms to raise price and the other firms
22 would kind of go along and permit it in a way they
23 wouldn't before. I mean, it's all kind of hypothetical.
24 I'm not sure this is a real, real thing. But in
25 principle, it's exactly right. And the guidelines are

1 conceptually correct, I believe, in saying what you're
2 referring to, that, the hypothetical monopolist could
3 raise the price of any or all of the additional products
4 under its control.

5 If you insist on what you want to insist on,
6 the way it was in the '84 guidelines before -- this got
7 changed in the '92 guidelines. If you insist on going
8 back to the way it was in the '84 guidelines at this
9 point, you run a different risk that there's going to be
10 a situation -- think about your example where there
11 really is a unilateral effects problem. You want to
12 prove a market in your view of how to write the
13 guidelines. You could get at the unilateral effects
14 problems and sell it to the court, let's say, in a market
15 that has five firms in it. But if you had to do an
16 across the board SSNIP, you would add an additional 20
17 firms, there's no way you'd convince anybody that there's
18 a problem.

19 So, I think it's correct to keep this in and
20 sensible besides. It's rarely used, but it's
21 appropriate.

22 MR. SIMONS: See, my view is, and I think -- I
23 think Whole Foods had this problem. You start to look
24 like you're gerrymandering a market so you don't have to
25 prove a competitive effect and you're going to rely on a

1 presumption. So I would rather -- let's define the
2 market the way it's originally been done. And when you
3 want to prove a unilateral effects, you prove that. And
4 if you do that sufficiently, you win. Otherwise, you're
5 going to be defining very narrow markets.

6 MR. BAKER: Okay. But you're running against
7 the usual litigation dilemma in unilateral effects cases
8 when you say that, which is that maybe the -- you know,
9 if the market shares aren't particularly meaningful and
10 the two merging firms have products that are fairly close
11 substitutes, but they are sort of in a little corner of a
12 bigger market, but you don't want to define a narrow
13 market, well, then you have low shares and it's hard to
14 convince anybody that there's a problem.

15 But then if you want to go the other route and
16 define the narrow market and say it's merger to monopoly
17 or near monopoly, then you run into the people who say,
18 well, narrow markets are gerrymandered and they're those
19 evil sub-markets and they're just -- they've got too many
20 adjectives. You end up missing the problem because of
21 this trouble.

22 MR. SIMONS: Well, no, you're trying to fit
23 your case into a structural presumption when you really
24 have a different case. I think the guidelines would be
25 benefitted if they would actually say something about

1 this circumstance where you can have a unilateral effect
2 in a broad market.

3 Because what tends to happen is -- and I think
4 it has something to do with the way it's litigated,
5 usually, is you go in and you try to say the market is
6 narrow and then you run into a problem when you lose on
7 the market definition. Whereas, if you just kind of
8 said, okay, here's the market, it's defined the normal
9 way it's defined and we have a unilateral effect and
10 here's the evidence we have for that, I think you might
11 have a different situation. If you clarified in the
12 guidelines that that's what you're doing and that's
13 appropriate to do, maybe you do better.

14 MR. BAKER: Well, I kind of agree with you
15 because the real problem in the story is that you're
16 trying to create a presumption of harm to competition in
17 this unilateral case based on market shares when they're
18 not particularly good indicators of anything in most
19 unilateral effects cases. And it would be very useful to
20 have an alternative basis for creating a presumption of
21 competition that a court could get its arms around that
22 would be based on something else that would be more
23 probative and then that would take the pressure off the
24 market definition in just the way you described and,
25 also, have the benefit of having a framework for

1 describing the harm to competition that you can explain
2 to the court that connects up to the source of the
3 evidence you're using to try and get that presumption.
4 So, it's --

5 MR. WHITE: John, I thought you were an ally
6 and you've just given into the devil.

7 UNIDENTIFIED MALE: We've got you surrounded,
8 Larry.

9 MR. WHITE: You know, come back to the basic
10 idea of relevant market is something that can be
11 monopolized, something where the price can go up if some
12 structural things change. And narrow, small. It doesn't
13 bother me in saying that's a market. You know, at some
14 point, it's de minimis. I understand that. But beyond
15 de minimis, small, narrow? Hey, if there's an effect,
16 there's an effect. Why confuse it by saying there's this
17 bigger market, but, oh, there's something going on here,
18 but we're not going to call this a market. Again, a
19 relevant market is something that can be monopolized.

20 MR. BAKER: That's not what I was arguing. I
21 agree with you. It's perfectly fine to have a narrow
22 market.

23 MR. WHITE: Well, both of you are the devil.

24 MR. BAKER: Neither one of you is the devil.

25 **(Laughter).**

1 MR. BAKER: No devils over there. My boss is
2 really an angel here. If we're forced into the market
3 definition paradigm for analyzing unilateral effects and
4 are going to have to argue it that way in court, there
5 are advantages to both approaches. I have no trouble
6 with narrow markets. I don't have trouble with sub-
7 markets when I can define them.

8 But what we were talking about before was
9 what's the best way of creating a presumption of anti-
10 competitive effects? Maybe you even want to do it
11 without market definition entirely in unilateral effects
12 cases or at least downplay it. The less you care about
13 market definition in unilateral effects cases, the more
14 you want to look for something else than market shares to
15 base your presumption on, the more important it is to
16 have some alternative and, frankly, the more sensible it
17 is because market shares are often not very good
18 predictors of harm in unilateral effects cases.

19 So, what I was saying before about the
20 presumptions was essentially independent of market
21 definition, not buying into either the large market or
22 the small market.

23 MR. FEINSTEIN: So, just to follow up real
24 quickly, if you don't define the market in a way that
25 allows you to estimate shares, if you focus on

1 competitive effects and don't get to the point where
2 there are presumptions, I suppose, what implication does
3 that have for the safe harbor analysis that currently
4 exists given certain HHI levels? What happens to it?
5 Anybody?

6 MR. SIMONS: It's not clear to me that there is
7 really a safe harbor. In real life, everything depends
8 on the market definition. So, if the market is defined
9 one way, okay, you're safe. If the market is defined
10 another way, you're not.

11 UNIDENTIFIED MALE: (Off microphone) Does that
12 mean if the market's defined very broadly, you shouldn't
13 be safe? You said even if the market had been all sales
14 of office consumables so that Office Depot and Staples
15 would have had 5 percent of the market, you're perfectly
16 comfortable saying that that merger is anti-competitive
17 and you think that's the way it should be litigated.

18 MR. SIMONS: No, here's what I'm trying to say.
19 What I'm trying to say is that the market definition
20 under the way it's currently structured comes with a
21 presumption if you get the shares high enough. Right?

22 UNIDENTIFIED MALE: (Off microphone)
23 (Inaudible).

24 MR. FEINSTEIN: I was focusing more on where
25 the shares were low enough. But go ahead.

1 MR. SIMONS: Usually people rely on a
2 presumption to prove a case and then you lose on the
3 shares. Right? And your story about competitive
4 effects.

5 MR. FEINSTEIN: John wants to say one more
6 thing and then I want to move on to a different issue.

7 MR. BAKER: This little conversation is related
8 to a point that I think Joe made before, Joe did it in
9 the context of talking about the Lerner Index. But the
10 unilateral effects analysis involving differentiated
11 products, if you're just looking at the substitution
12 across the firms and you're not thinking about other
13 aspects of the analysis, it will look like all mergers
14 will, at least initially, have a tendency to raise price.
15 And this was -- you know, we knew this in 1992 when we
16 put that section in the guidelines.

17 But the answer is that's not true, I mean, in
18 the sense that there's more to merger analysis than just
19 -- the full competitive effects analysis goes beyond the
20 buyer substitution and the first and second choice
21 products. And when you get to the -- beyond the
22 presumption, you can rebut it. You can think about
23 repositioning and you can think about efficiencies.

24 Now, when Carl and Joe wrote their recent paper
25 about how to use diversion ratios and margins to create

1 something that could be sort of like the basis of a
2 presumption, they built in an efficiencies assumption in
3 there. So, essentially the price has to rise more than a
4 certain amount or after a standard deduction, I think was
5 the phrase that came -- or was it Larry, maybe? I don't
6 know. That's one way to handle it.

7 So, going down this route of proving unilateral
8 effects without a market definition or at least building
9 in a presumption through a route that doesn't require
10 market shares and market concentration isn't the same
11 thing as saying all mergers are going to lead to higher
12 prices, because you can set it up in a way that
13 incorporates some assumption about efficiencies or
14 repositioning that would limit the cases to the ones
15 where the concern is the greatest about a price rise.

16 MR. SIMONS: But that strikes me as kind of
17 artificial because you then recognize that the underlying
18 process produces a price increase for every horizontal
19 merger and you realize that's not right. So, you're kind
20 of using the efficiencies as a standard deduction to
21 calibrate it down. But how do we know that that's even
22 close to being properly calibrated?

23 MR. BAKER: Well, we have to do better than the
24 35 percent safe harbor in the current guidelines or even
25 the low HHI safe harbor in the current guidelines when it

1 comes to unilateral effects because the market shares
2 aren't very helpful in analyzing unilateral effects in a
3 lot of cases. So, this has got to be a better route.

4 MR. SIMONS: Well, the problem is if you use
5 this, though, you're going to end up challenging mergers
6 at much lower concentration levels than you're -- you
7 know, you're going to be challenging lots of mergers you
8 never would have challenged before.

9 MR. BAKER: Would you view the Staples/Office
10 Depot merger as a merger at a lower concentration level
11 or do you view it as a merger at a high concentration
12 level? The concentration level that you get depends on
13 the market definition, and that may or may not be helpful
14 here.

15 MR. SIMONS: Well, I guess it depends on which
16 market definition you have in mind. Whether you're going
17 to do the variable SSNIP or whether you're going to do
18 across the board SSNIP.

19 MR. FEINSTEIN: Let me shift slightly, although
20 we're going to stay on the topic of SSNIP for a minute.
21 I think there's a fairly broad consensus that that's a
22 useful tool in the market definition process. But in
23 connection with the possibility of revising the
24 guidelines, I'd be interested in hearing the panel's
25 views on the question of whether the level of the SSNIP

1 should either be revised to the general proposition or
2 should be made more variable depending upon particular
3 circumstances. How, if at all, would you address that
4 issue? That is the possibility of selecting what level
5 of SSNIP ought to be used and when. Yes?

6 MR. PEREZ MOTTA: Actually, my impression is
7 that this should have some flexibility. In our case, our
8 Commission does not apply this formally. But we normally
9 consider a range between 5 to 10 percent that follow
10 basically the U.S. and the E.U. parameters. But you
11 could have some cases, for instance, when the size may be
12 substantially smaller in markets with low price cost
13 margins, for instance. So, I think flexibility should be
14 there.

15 MR. FEINSTEIN: Anyone else want to comment on
16 that?

17 MR. SIMONS: I would go back to Larry's kind of
18 first principle on market definition, certainly for the
19 unilateral cases. And that is, you're worried about you
20 want to identify a market that is being cartelized. So,
21 you might have a situation where probably on average, 5
22 to 10 percent is probably good. But there might be cases
23 in which, you know, a 5 to 10 percent price increase
24 won't work, but a 20 percent price increase might. And
25 if you come across that, well, you should use it.

1 On the lower end, my view is a little more
2 ambiguous, I guess, because I'm not really sure that once
3 you start to get down to 1 or 2 percent, whether that's
4 really something that you can really apply with any kind
5 of confidence just because there's so much noise at that
6 level.

7 MR. FEINSTEIN: Yes, John?

8 MR. BAKER: Well, I have no objection to a
9 variable SSNIP and it might make sense, but I want to
10 take a step back, also, in sort of the way Joe and Larry
11 were doing. I think there are all sorts of markets in
12 which transactions can be analyzed. There are markets
13 that are overlapping with each other. That is to say, if
14 there's any market in the sense that Larry was
15 emphasizing, that would be one that would be profitable
16 monopolizing, which this particular merger presents a
17 problem, the agency ought to challenge it.

18 And if it doesn't look like you get one with a
19 small SSNIP, but you get a different market with a larger
20 one, that's one where it looks like there's a problem or
21 vice versa, you ought to challenge it in either one of
22 those that you see. But the real problem is not with
23 SSNIP -- that's really only an imperfect substitute for
24 getting rid of the smallest market principle which is the
25 real underlying problem. Because there's no reason to

1 tie yourself to some smallest market when, you know, if
2 there's a competitive problem in a larger one, why not
3 analyze it in that? The goal is to figure out where
4 there's a problem and challenge bad mergers, not to have
5 finality to an arbitrary smallest market that can get in
6 the way of doing that.

7 MR. FEINSTEIN: You've anticipated what I was
8 coming to next, which is the smallest market principle
9 and the methodology which adds products in the order of
10 next best substitutes. Are those areas that the panel
11 would agree with, John, are good candidates for
12 modification or are as they should be now?

13 MR. WHITE: Well, the way I read the guidelines
14 is there's enough generality there, that it's sort of
15 generally the smallest, but it encompasses the kinds of
16 possibilities that John just described. So, I don't see
17 any need for big change there. Unless there's just too
18 much confusion and so there needs to be a little bit of
19 clarifying language.

20 MR. FEINSTEIN: Joe?

21 MR. SIMONS: Yeah, just to me it's not really
22 clear why that was ever put in there. So, I mean, if it
23 could get clarified, maybe that would be helpful and keep
24 it in, or if it can't, then maybe take it out.

25 MR. FEINSTEIN: So far our entire discussion

1 has been, at least implicitly, focused on product market
2 issues. I'd like to solicit the thoughts of this panel
3 on the general topic of geographic market. The notion of
4 a relevant market obviously includes both components, but
5 we've really been, at least implicitly, focusing on
6 identifying the products. Does the current treatment of
7 geographic market in the guidelines call for modification
8 in your opinion or your opinions?

9 MR. WHITE: I don't think so. You're right,
10 especially in unilateral effects, we tend to be thinking
11 in terms of -- the phrase I use, you know, customers
12 trapped between two -- their first and second choice
13 products, but you can think of customers trapped
14 geographically just as well. So, I tend to generally in
15 both dimensions, both product space and geographic space,
16 I don't see any need for greater clarification there.

17 MR. FEINSTEIN: Joe, John, Eduardo?

18 MR. SIMONS: The only thing that occurred to me
19 was that if the product is being sold on a deliberate
20 basis, then you might have a geographic price
21 discrimination and then maybe you want to define it by
22 the customers.

23 MR. BAKER: Well, I gather the context of this
24 question is the way that the geographic market definition
25 section talks about the hypothetical model says the only

1 present or future producer of the relevant product at
2 locations, and that the issue is when you think about
3 buyer substitution, the buyers aren't substituting to the
4 location where the producer produces; it's the location
5 where the producer sells. And I think that would be the
6 right thing to do would be to -- I think that must be
7 what's meant and to change it from producer to seller.
8 But it's really the -- I think everyone does it that way
9 in practice.

10 MR. FEINSTEIN: We've got three economists and
11 two lawyers on this panel, the second lawyer being the
12 moderator. But I want to ask a question about the use of
13 non-economic evidence. It ties in a little bit, I think,
14 with the point that was made earlier about dealing -- you
15 know, judges are typically generalists and may not be as
16 conversant in some of the topics that we've been talking
17 about. I'd be interested in hearing from each of you
18 your views on the role of non-economic evidence, in
19 particular, things like customer statements or internal
20 documents which reflect business people's assessment of
21 the competitive landscape. What role should that kind of
22 evidence play in the market definition exercise that
23 we've been discussing? Eduardo?

24 MR. PEREZ MOTTA: I think you should use it.
25 Not only to use the non-economic evidence, but also when

1 -- I'm just looking at this problem on the authority
2 side. You have to understand that in the end, the person
3 that is going to judge your resolution is a non-
4 economist. So, the problem, I think, is a little bit
5 more general. It's not only the use or the possibility
6 to be open to use non-economic elements. In this case,
7 we are -- in Mexico, we are pragmatic in that sense,
8 especially when you find a merger with direct evidence --
9 this goes to your first question as well. With the
10 direct evidence, you don't see a problem.

11 If it's clear that there is not a problem with
12 that case, you have to stop there. You don't have to go
13 further. And there you include non-economic or direct
14 evidence on markets, which is important.

15 Now, if you have to go to the economic analysis
16 and you have to define the relevant market and then to
17 follow all the five steps that I was describing at the
18 beginning, I think the challenge that you have as an
19 agency, a competition agency, is something that is fairly
20 obvious. But sometimes it's not easy to do. It's how
21 you can explain all the sophisticated analyses that you
22 are using in very simple terms, strong and very well
23 articulated, but simple so that judges could understand
24 easily your analysis and could evaluate and judge not
25 only your procedures, but the substance of what you are

1 doing.

2 MR. FEINSTEIN: John.

3 MR. BAKER: Well, so I approach this question
4 this way. We're interested in the economic force of
5 buyer substitution in defining markets and, more
6 precisely, the way the question has been refined in the
7 context of the guidelines, how buyers would substitute in
8 response to a price increase.

9 I think of the evidence that one might bring to
10 bear in answering that question as falling into five
11 different categories. The first is, how have buyers
12 responded to changes in the relative prices in the past?
13 It's something one could think about. The second is,
14 what do buyers say -- you know, you survey them or
15 whatever -- about how they would likely respond today if
16 prices were to change?

17 The third is inferring something about likely
18 buyer responses to changes in prices from characteristics
19 of the products and locations that are known to matter to
20 buyers. So, what I have in mind there, for example,
21 might be you work out the engineering study of the
22 switching costs in geographic market definition and would
23 it be profitable to go a little bit further in the amount
24 of price rise to get your product or not? But we could
25 do this on the product side as well.

1 The fourth category is inference about buyer
2 substitution from the conduct of sellers. Sellers are
3 experts on their buyers. So, if the sellers are
4 monitoring price changes at certain rival firms, certain
5 rival products and responding to them, then you're
6 learning actually about buyer substitution from that
7 because you're making an inference -- you're learning
8 what these experts think about buyer substitution.

9 Then the fifth category is the views of other
10 industry experts, you know, more broadly than the
11 sellers. So, consultants or former executives or trade
12 association folks or sellers of complementary products
13 who know about the market they sell into or buy from.

14 So, there are five categories of evidence.
15 Each of those categories you could have evidence that is
16 systematic and quantitative or that's anecdotal or
17 qualitative. So, even for the response of buyers to
18 price changes in the past, you might think, well, you're
19 talking about measuring demand elasticities. Well, maybe
20 I am, but you might also just be asking the firms'
21 executives who have -- I remember a consulting thing I
22 worked once where the company said, well, yeah, we tried
23 raising price in Milwaukee, you know, on our product and
24 we got hammered. Well, that's evidence about the
25 response of buyers to changes in prices in the past. And

1 all of these types of evidence can, in different cases,
2 be probative.

3 And, so, what you are really looking for is the
4 type of evidence and the style, the form, you know, the
5 qualitative, quantitative, whatever, that happens to be
6 most probative in the particular facts of the case. And
7 you rely on that or you put it all together. So, I don't
8 think there is any general preference for any type of
9 evidence or any form in which it comes.

10 MR. WHITE: Okay, I'm really intrigued with
11 what John just said. I was going to stop with just his
12 categories one and two, which I would paraphrase what did
13 consumers do in the past in response to price changes of
14 which the sophisticated version is working out demand
15 elasticities and diversion ratios, et cetera, versus a
16 consumer survey, what would they do in the future in
17 response?

18 Now, empirical economists' bias is to trust
19 more the category one rather than category two because,
20 gee, you know, can they really imagine all the full
21 circumstances? The "would" feels much weaker than the
22 "did" so long as can you do the appropriate controlling
23 for other things, et cetera, et cetera, et cetera.

24 I started thinking about, though, his third
25 category. All right, you get engineering studies

1 inferring switching costs. But where did those data come
2 from? Either they came from "what did" or "what would."
3 You know, where else have the engineers come up with the
4 parameters for that estimate?

5 Now, category four, gee, that's pretty strong.
6 I mean, I absolutely endorse John's insight here that the
7 sellers revealed behavior here telling you something
8 about "what did." I mean, sort of strong, strong
9 information about "what did."

10 And then category five, use of other industry
11 experts. Well, again, you're back to where did they get
12 their information? It's either from "what did" or "what
13 would." So, I think it's really useful to focus on the
14 two categories. "What did," "what would."

15 As an economist, I like "what did" better. And
16 I like John's extra insight, look at, whenever you can,
17 past seller's behavior, but it's going to be based on
18 "what did."

19 MR. FEINSTEIN: Joe.

20 MR. SIMONS: So, the funny thing about the
21 discussion so far, at least from my lawyer's perspective,
22 is that if you looked at the guidelines, those things are
23 kind of listed in the guidelines already. But the thing
24 that's not listed in the guidelines is econometrics. So,
25 I don't know, maybe you want to put that in there. Maybe

1 not.

2 But the only point I would make is that it's --
3 this non-economic evidence is the most important because
4 you can win a case, you can have a case without the
5 econometric evidence. If you just have the econometric
6 evidence, I don't think you're going to win a case if
7 that's all you have. Like I said, the best case is
8 everything points in the same direction.

9 MR. FEINSTEIN: We are right at our end point,
10 but I'm going to ask the audience's indulgence to give us
11 two more minutes. There are four of us. If any of you
12 would like, in 30 seconds, to offer a final observation,
13 now's your opportunity. Let's start with Joe and work
14 our way back.

15 MR. SIMONS: I think I've said everything I
16 would say, so I don't need to take up your time.

17 MR. FEINSTEIN: Okay, not required.

18 MR. WHITE: Okay, I want to make two points.
19 One, I didn't add --

20 MR. FEINSTEIN: You can take Joe's time.

21 MR. WHITE: Okay. Which was, you know, there
22 may be times when you don't have any "what did" evidence
23 and, so, the best you can do is use the survey "what
24 would" and you just do the best you can with it. So, I
25 don't want to rule out "what would", but you have to

1 understand its limitation.

2 The other thing, I'm really glad you mentioned
3 econometrics, Joe. Econometrics gets a bad rap. It's
4 just statistics, guys. And you understand means okay?
5 And you can understand the idea that, you know, means
6 might be different. Well, econometrics is just a
7 slightly more complicated version of that where you've
8 got to try to start controlling other things.

9 The fact that you may not have a lot of
10 training in econometrics, if you were dealing with a
11 traffic accident case, you might have engineers coming in
12 to try to tell you about whether the brakes failed or
13 didn't fail or the skid properties of asphalt when it's
14 wet to this degree and maybe you need to bring a
15 meteorologist in. And there's going to be all kinds of
16 expertise that you may not have. Sorry, econometrics is,
17 again, it's just another set of expertise. It's like
18 dealing with means and averages, only a little more
19 complicated.

20 MR. FEINSTEIN: John.

21 MR. BAKER: I just thought I'd add that my
22 engineer has another source of expertise, too.

23 MR. FEINSTEIN: Eduardo.

24 MR. PEREZ MOTTA: Let me just touch on the
25 econometrics discussion. I think in the end the

1 challenge that we have is how to explain the econometric
2 results in such a way that you can make something that is
3 easy to understand. So, I think both things go in -- you
4 can make them work in the same direction. Sometimes you
5 need a sophisticated econometric analysis to protect your
6 decision and you have to use it, and I think it's better
7 to use it.

8 But the challenge is how you can put that you
9 in words that could be understandable for a person that
10 is going to judge your decision, that is going to be a
11 lawyer.

12 MR. FEINSTEIN: I guess the final observation I
13 would make -- maybe the first observation I would offer
14 is picking up on Larry's distinction between "what did"
15 happen and "what would" happen. Unless you're talking
16 about a consummated transaction, at the end of the day,
17 we are always trying to figure out what will happen.
18 And, therefore, I think both "what did" and "what would"
19 are probative.

20 Please join me in thanking this panel, and
21 we'll reconvene at 3:30 for the final panel of the day
22 which will address unilateral effects. Thank you very
23 much.

24 **(Applause.)**

25 **(Panel 3 concluded.)**

1 **PANEL FOUR: UNILATERAL EFFECTS**

2 MR. SHAPIRO: Let us resume here for our last
3 panel of the day. I'm Carl Shapiro, Chief Economist over
4 at the Justice Department, one of the people on the
5 working group. Thank you, guys, for being here and for
6 sticking around until the last panel. I appreciate the
7 interest.

8 Before I introduce the panel, I came with my
9 copy of the merger guidelines; I never go anywhere
10 without the canary yellow merger guidelines. The blue
11 one doesn't have the '97 revisions. See, this is the '92
12 guidelines. See, this is why you need to learn more about
13 efficiencies, okay? We'll talk about that. Your clients
14 could benefit from that, I'm sure. Yellow is '97, okay?

15 But little did I realize the FTC version with
16 the beautiful picture of the FTC that was going to be
17 available for everybody today -- now, I suppose I'll have
18 to assign some of my staff to make sure there's no
19 additional things here that are not in the joint version.
20 So, everybody, this is a big opportunity to get your own
21 copy of the guidelines with the -- get them while they're
22 still in force.

23 Okay, let me very briefly introduce the
24 panelists. The topic is unilateral effects. We've
25 touched on that and it's come up a number of times

1 earlier today, probably, in fact, on all the panels to
2 some degree. So, on the right-hand side, from my
3 perspective, Alison Oldale is a Chief Economist at the UK
4 Competition Commissioner. We're especially appreciative
5 to her for coming so far to speak with us today,
6 particularly given the UK's experience with their own
7 merger guidelines and unilateral effects analysis. So,
8 thank you, Alison.

9 Next to her is Renata Hesse, a partner at
10 Wilson Sonsini. Renata has quite a bit of experience in
11 the Antitrust Division -- in fact, that's when we first
12 met -- as well as now in private practice. So, I look
13 forward to that dual perspective.

14 The same thing could be said of M. J.
15 Moltenbrey, who is a partner at Howrey, also many years
16 of experience in the Antitrust Division and now in
17 private practice. So, that's extremely valuable.

18 On my left, Steve Salop, my longtime friend.
19 We were consultants together at Charles River. He's a
20 Professor of Economics and Law at Georgetown University
21 Law Center across the street and a senior consultant at
22 Charles River Associates.

23 And at the end, Marius Schwartz, Professor of
24 Economics at Georgetown University, Senior Academic
25 Affiliate of Bates White, also a great friend of the

1 Antitrust Division. Thank you, both.

2 As we've been doing in the other panels today,
3 I want to give each of the panelists five to ten minutes
4 to make some opening statements and then we'll have
5 discussion.

6 Let me just very quickly frame what I see as
7 one of our goals. We had one detailed question in our
8 questions for public comment on unilateral effects. It
9 happens to be question number ten, where we pointed out
10 that unilateral effects were introduced in the guidelines
11 in '92. There's been a lot of experience gained since
12 then. The overall question here, I think, is -- we put
13 it there -- should the guidelines be updated to reflect
14 this experience and the learning that's taken place in
15 the intervening 17 and 18 years, and we list the number
16 of ways in which that might happen.

17 It's pretty clear from earlier panels today,
18 there are a set of issues around how unilateral effects
19 interacts with the market definition. We heard, for
20 example, Larry White, and I think perhaps Jonathan Baker
21 as well, in the previous panel saying, well, if you've
22 identified an effect, maybe a unilateral effect, raising
23 of the prices of the products sold by the merging firms,
24 that there must be market around that and that maybe you
25 could short-circuit or back out market definition.

1 So, there's an intersection with market
2 definition. There's clearly an intersection as well with
3 what generally we're calling direct evidence; that is to
4 say, evidence that's not based on inferences from market
5 structure. And earlier we heard, for example, Bobby
6 Willig say, well, you should look at a variety of
7 evidence, maybe you don't want to have particular pieces
8 of it and get carried away about that. But we'd want to
9 talk about what would be the most probative and
10 convincing evidence regarding unilateral effects and
11 could the guidelines say more about that because they
12 don't get into any detail on what lines of inquiry are
13 followed. I mean, they explain the basic logic of
14 unilateral effects, but don't go beyond that. It's a
15 question. Would it benefit if they did so?

16 So, with that framing, let's start with Alison.

17 MS. OLDALE: Hi. I want to start by thanking
18 the FTC and the DOJ for inviting me here to participate
19 in the debate about the U.S. guidelines. As Carl
20 mentioned, in the UK, we are in the middle of revising
21 our own merger guidelines. So, I know how challenging it
22 can be to look back over recent practice and learning and
23 to try to capture all of that in a clear way in
24 guidelines and how much more challenging it is to take on
25 board the often passionately expressed views of

1 commentators, practitioners and others. Challenging, but
2 hopefully leading to better guidelines. And I commend
3 the FTC and the DOJ for organizing these workshops.

4 I'm going to make some opening remarks about
5 the UK's experience of unilateral effects analysis in
6 merger controls, focusing on differentiated products
7 markets. In one very important sense, there's nothing
8 unusual at all about the UK experience. If we're looking
9 at the case where we think there might be unilateral
10 effects, we will be focusing very much on trying to work
11 out what effect the merger has on the pricing incentives
12 of the parties, we'll be trying to understand how they
13 compete with each other, what other constraints there are
14 that might effect what their behavior will be after the
15 merger and generally how the market operates.

16 We do think about market definition, but it
17 doesn't dominate or determine or drive our analysis. And
18 I understand that's pretty much the way the agencies here
19 in the States actually do their cases. Perhaps what's
20 unusual in the UK is how explicit we are that this is
21 what we're doing. And that comes through in a number of
22 ways.

23 Our existing guidelines stress that market
24 definition and unilateral effect analysis interact. It's
25 not just a sequential process of doing one and then the

1 other and that both of them often rest on very similar
2 analysis on a very similar fact base.

3 If you look through our decisions, it's very
4 rare that you will see a huge amount of emphasis on
5 concentration measures and it's very unusual that we will
6 put a huge amount of weight on them. In particular,
7 recent decisions are becoming quite explicit that high
8 margins and high diversion ratios are pretty good
9 evidence that a merger will lead to a big change in the
10 pricing incentives of the merging parties. And this is
11 often captured in a measure of -- some measure of the
12 pricing pressure, the upward pricing pressure that a
13 merger creates. The version we use we call additive
14 price rise. And we are currently revising our guidelines
15 to make all this even more explicit.

16 So, the draft that was put out for consultation
17 in the summer also notes the evidential value of high
18 margin and high diversion ratios for thinking about the
19 change in pricing incentives of merging parties when
20 we're looking at unilateral effects and differentiated
21 products markets.

22 It's also worth noting in the context of some
23 of the debates that have been going on earlier our
24 existing guidelines. We already mentioned critical loss
25 analysis as a framework for thinking about how to apply

1 the hypothetical monopolist test. In the new guidelines,
2 we're a bit more explicit that margins can tell you
3 something about elasticities and you might want to use
4 that in your critical loss.

5 How have parties and practitioners responded to
6 all of this? Well, there have been three main comments.
7 The first comment is, come on, guys, this is all too easy
8 for yourselves, all you're doing is looking at the
9 relationship between the two parties. What about all of
10 those other constraints that market definition process
11 highlights and forces upon you? We do need to address
12 this perception, I think. And we are trying to do that
13 in some of the decisions.

14 So, the points I think that we're trying to
15 make is to stress that unilateral effects analysis uses
16 all of the information about all of the other
17 constraints. There's no lack of discipline involved in
18 looking at unilateral effects. For example, the
19 diversion ratio is a ratio. On the top, you may have
20 just the diversion between the merging parties. But on
21 the bottom, you've got the whole world. So, you've got
22 the diversion to everything else that might be acting as
23 a constraint. They don't get lost in the analysis.

24 And, also, in order to implement some sort of
25 unilateral effects analysis, you really do need to know

1 quite a lot about the nature of competition and the
2 intensity of competition on the market. That's where the
3 margins and the elasticities come in.

4 You still have to think about entry,
5 repositioning and buyer power once you've done your
6 initial analysis of whether there's the upward pressure
7 on pricing, just as you do if you start with market
8 definition and concentration measures.

9 So, we're hoping to stress that nothing gets
10 lost in what we're doing. Again, in some very recent
11 decisions we are more explicit that high margins and high
12 diversion ratios not only suggest a big change in the
13 pricing incentives of the merging parties, but also
14 suggest that the merging parties form a big part of the
15 defined market, if not a market unto themselves.

16 To use a phrase that one of my colleagues at
17 the OFT, Chris Walters, who's been injecting a lot of
18 energy into the process of getting these things into our
19 practice, he uses the phrase "back into market definition
20 from the unilateral effects analysis," which I think Carl
21 mentioned earlier as well.

22 So, that's the first comment. The first
23 comment is, guys, you're making life too easy for
24 yourselves, you're losing discipline. The second comment
25 is, hang on, this is all too difficult and onerous and

1 requires far too much information. Well, again, I do
2 think we need to address this. And the way to do it, I
3 believe, is to stress in our decisions the commonality
4 between market definition and unilateral effects, as I've
5 just mentioned. But in particular in this case, how
6 similar the question is. It is a really similar
7 question.

8 So, the question for the -- the unilateral
9 effects question is, would a hypothetical monopoly
10 supplier of the party's products raise their prices? And
11 the question for the market definition exercise is, would
12 a hypothetical monopoly supplier of the party's products,
13 plus a bunch of other stuff, raise prices? So, it's a
14 very, very similar question. There's no particular
15 reasons for thinking that either of them is more or less
16 difficult than the other.

17 So, that's the first question. It's all too
18 easy. The second question, it's all too difficult. But
19 to be honest, the most common comment that we get is,
20 okay, if you're going to do it, please tell me how. Lots
21 of these cases are in retail mergers where the parties
22 just want to know where they've got to make divestments.
23 Most of the debate that we have with parties and their
24 practitioners is about the details of how to do it,
25 rather than the principles. And I confess, this is all a

1 work in progress. There are quote a lot of practical
2 questions that we are working on through our casework,
3 but they're not closed yet.

4 A biggie, margins and how to measure them.
5 It's going to be increasingly important that we really
6 understand how to do that. Diversion ratios and where to
7 get them from. Can we rely on surveys and so on? What
8 is the measure of upward pricing pressure that we should
9 use? I said that we have been using a particular one,
10 but there are questions, what to do when you have multi-
11 product firms. Do you use the same sort of model? How
12 do you deal with asymmetry? Again, do you use the same
13 model or should you see some variance? What about all of
14 the sensitivity to the demand function? We need to
15 continue looking at these things.

16 And then, finally, materiality. If we're going
17 to start getting indications of some sort of upward
18 pressure on prices, then how much is too much? I really
19 like the approach of trying to link this pricing pressure
20 to some sort of measure of required offsetting
21 efficiencies, following Werden, Farrell and Shapiro. And
22 to me, it's the end game of a clearer focus on unilateral
23 effects, it's a clearer focus of thinking about
24 efficiencies and materiality, then I, for one, would
25 think that was a good thing. Thank you.

1 MR. SHAPIRO: Thank you very much, Alison.

2 Before I go to our next speaker, I may put you on the
3 spot a little bit and could you just take another minute
4 to tell us where you are in your process? I know you had
5 a bunch of comments filed on your own proposed merger
6 guidelines review. What's the next step?

7 MS. OLDALE: The next step will be to revise
8 the draft guidelines in light of those comments and then
9 put them out there, hopefully the beginning of next year.

10 MR. SHAPIRO: Okay, well, good luck.

11 MS. OLDALE: Thank you.

12 MR. SHAPIRO: And thank you. Next, M. J.
13 Moltenbrey.

14 MS. MOLTENBREY: Let me start with what I think
15 is probably, at least on this panel and perhaps in
16 general, a relatively noncontroversial position that,
17 yes, the unilateral effects section of the current
18 guidelines should be revised. There may be a little more
19 disagreement about exactly how that should be done.

20 As many people have mentioned and Carl
21 mentioned in his introduction, the unilateral effects
22 portion of the guidelines, as a separate and distinct
23 analytical exercise in merger review, was introduced in
24 the '92 revisions of the guidelines. And at the time, I
25 was a staff attorney at the Department of Justice. And I

1 can say that those guidelines and the introduction of
2 those guidelines did have a significant impact on the way
3 I and my colleagues looked at mergers and thought about
4 competitive effects analysis when looking at a merger.
5 Not that no unilateral effects analysis had been done
6 prior to the guidelines, but it really did kind of
7 institutionalize and discipline the process quite a bit.

8 I don't have any statistics. I haven't tried
9 to do this statistically, but if you do a kind of cursory
10 review of recent cases brought by both the FTC and the
11 DOJ, it's clear that unilateral effects theories of
12 competitive harm have been increasingly important and
13 prevalent, and more and more, there is a unilateral
14 effects theory pled either on its own or in addition to a
15 coordinated effects theory, which, again, is something
16 that is fairly different from when I first started
17 practicing antitrust law.

18 If you're an antitrust lawyer or an economist,
19 unless have you been in the cave for the past couple of
20 years, you're going to be familiar with some of the work
21 that Carl and Joe Farrell have done on trying to develop
22 models for measuring unilateral effects in mergers,
23 looking at division ratios and margins and trying to
24 develop an index to measure the effects of a merger and,
25 basically, abandoning reliance on concentration as an

1 indicator of likely competitive effects.

2 I recognize this is done in their private
3 capacity not in their capacities as the heads of the
4 economic teams at the two agencies. And that's only one
5 example of some of the thinking that's going on and some
6 of the more sophisticated economic analysis that is out
7 there and available to people to use when looking at
8 unilateral effects -- potential unilateral effects cases.

9 Another observation I will make, though, is
10 that while the agencies seem to be looking at unilateral
11 effects and people are thinking a lot about unilateral
12 effects, it seems that the courts have not been quite as
13 enthusiastic in terms of adopting or following or
14 accepting the theories that had been posited by the
15 agencies, certainly not in some of the litigated cases.

16 Just a couple of examples, I would point to the
17 baby foods case, the Whole Foods/Wild Oats merger and
18 Oracle/PeopleSoft, examples where, at least at the trial
19 court level, the court seemed to struggle with the
20 agency's use of a unilateral effects theory and the
21 evidence that the agencies were relying on.

22 And then even at the appellate court level,
23 where the government has prevailed, for example, in the
24 Wild Oats case, whether you agree with the outcome of the
25 decision or not, it's hard not to see some significant

1 flaws in the reasoning of the court and the court's
2 ability to take some pretty complicated economic concepts
3 and apply them, again, dealing with a court that was very
4 much a generalist judge and not an antitrust specialist.

5 And, so, it seems to be that there's a clear
6 need or a clear potential benefit of clarifying and
7 expanding the merger guidelines to incorporate some of
8 the agency's learning, to explain better what the
9 agencies are doing. I am going to leave, I guess, for
10 the discussion period because I don't want to take up too
11 much time, some of the more detailed suggestions that I
12 might make, but I do want to make a couple of
13 observations where I think changes might be warranted.

14 It has come up several times today and Carl
15 mentioned it again in his introduction, that it's hard to
16 talk about unilateral effects analysis and not talk about
17 market definition issues. But in the current guidelines
18 as written, there's a lot of clumsiness in the way the
19 unilateral effects portion of the guidelines talks about
20 market definition and tries to incorporate it. At the
21 time they were written, I'm sure there were a lot of
22 efforts to kind of make this seem like not such a
23 dramatic departure from what had been going on and what
24 had happened under the prior guidelines. So, the
25 unilateral effects section references things like the

1 safe harbors of the HHI numbers and references 35
2 percent market share. In a lot of cases, not all, but in
3 a lot of cases, when you actually try and apply, there's
4 just really a logical disconnect.

5 If you are dealing with a merger involving two
6 companies that are their closest substitutes and you
7 apply product market definition, so you start with
8 product A and you add the next best substitute, by
9 definition it's product B and the merging party's
10 product, and ask whether a hypothetical monopolist could
11 raise price. Well, if you have a unilateral effects
12 case, the answer is, yes, they could raise price and,
13 therefore, that is your product market.

14 To then turn around and say, and then we look
15 at whether or not you are above the HHI thresholds or
16 whether or not you have a 35 percent market share is a
17 bit tautological because almost by definition you have
18 just decided that you have 100 percent combined market
19 share for those two combined products.

20 In other circumstances, let's take a market
21 where you have products A, products B, and products C,
22 and in the event of a price rise of 5 percent or more in
23 product A, most customers would shift to B but a
24 significant number would shift to product C. As a
25 consequence of this merger, you believe that when A can

1 capture those increased sales that would shift to C,
2 suddenly a price increase that would not have been
3 profitable beforehand, would become profitable.

4 If you actually do the merger guidelines'
5 current product market definition exercise, you start
6 with A, you add B, because that's the next best
7 substitute. Most people would switch to B. You ask
8 whether the monopolist could or would raise price
9 profitably. The answer is yes. You have defined your
10 market. C is not even in your market. Although,
11 clearly, we know that there is a competitive effect when
12 A merges with C.

13 So, in both of those examples, it's clear
14 there's really not a good fit between what the agencies
15 are doing and how the current guidelines suggest that you
16 go about market definition. This just gets confused even
17 further when you start talking about whether or not you
18 are within or outside the safe harbors of HHI thresholds
19 or whether or not you have a combined share of 35
20 percent. So, at a minimum, I think, one of the exercises
21 in the revision should be to clarify some of that
22 confusion.

23 There are cases where you're going to find a
24 unilateral effect with a merger, but you're not going to
25 define it as a complete market. One example might be

1 that you decide that if A and B combine, A could raise
2 prices by 3 percent, but not by 5 percent. So, okay,
3 maybe you don't meet the SSNIP test. So, you're going to
4 start adding more products in. So, maybe there are some
5 cases where you're going to have a properly defined
6 product market under the existing market definition
7 principles that doesn't just consist of the two merging
8 companies. But that's only one of the many possibilities
9 that might come about. So, I think that's an area that
10 clearly could benefit from greater clarity and
11 elucidation.

12 I could talk about that for a while, but I know
13 others on the panel can probably talk about it in more
14 detail than I will. So, I'll just mention one other area
15 that I think might benefit from clarification. Section
16 2.212 of the current guidelines suggests that --

17 MR. SHAPIRO: Get your copies out. Come on.

18 MS. MOLTENBREY: If other participants -- I'm
19 not going to say in the market because I'm not sure that
20 makes sense, but other participants in the industry might
21 reposition so that they would capture more of the lost
22 sales of the merging companies, that you would not likely
23 have an anti-competitive effect and that should be taken
24 into account.

25 But both in the merger guidelines commentary

1 and I would suggest even in the agency practice, what was
2 given with one hand seems to be taken away with the
3 other. In the commentary, the agencies have said that
4 they rarely find that repositioning would be sufficient
5 to overcome a unilateral effect and, in fact, it is hard
6 to find cases where it appears that the agencies accepted
7 a repositioning argument. I think that is an area that,
8 again, warrants maybe more than the very brief attention
9 that's given to it in the existing guidelines and ought
10 to either be revised -- depending on who you ask, either
11 the guidelines or the agency practice might need
12 revisions.

13 And I will stop there and save the rest for
14 question and answer.

15 MR. SHAPIRO: Okay, thanks, M. J., Marius
16 Schwartz next.

17 MR. SCHWARTZ: Okay, thanks, Carl.

18 You all posed 20 great questions and question
19 10 has eight parts and I'm only going to deal with one
20 part of question 10, which is the relationship between
21 market definition and unilateral effects and only one
22 aspect of that, and that is what type of evidence should
23 we use in merger review and why? Direct or structural?
24 And the quick answer, of course, is you use both. The
25 order shouldn't matter, as has been mentioned. And you

1 should iterate between these two types of evidence.

2 None of this is remarkable, of course, but I
3 hope to flush out the reasons for doing that and
4 illustrate with an example from a merger challenge that
5 was brought by the Department of Justice where I was an
6 expert.

7 So, go back to what a horizontal merger does.
8 It consolidates the ownership of assets used by the firms
9 to compete in supplying their overlap product or
10 services. So, a necessary condition for there to be the
11 risk of substantial harm to consumers, is that the
12 requisite assets very broadly defined tangible,
13 intangible, whatever it takes to supply this stuff, are
14 in sufficiently scarce supply to other firms, at least
15 over the relevant time frame. That seems like a no-
16 brainer. That's a necessary, not sufficient, condition
17 because there could still be efficiencies.

18 So, a fundamental question -- maybe the
19 fundamental question is, do the merged firms possess some
20 unique assets? That's the question. And relatively
21 important unique assets. Of course, the operational
22 challenge is, how do you get at this from the kind of
23 evidence you have in practice?

24 There are two ways to start the inquiry which
25 starts off with different types of information. I'm

1 going to call one bottom up, which is start by trying to
2 identify the fundamental assets that are needed and who
3 might have them, and the other one is top down. Start
4 with evidence about competitive outcomes, who seems to be
5 competing with who, what are the results, and then try to
6 understand the why, the drivers.

7 The bottom up approach starts by trying to
8 identify the key attributes of the competing products,
9 the physical dimensions, the geography, and so on. And
10 then asking which other firms have or could easily get
11 these things to get the assets needed to generate those
12 attributes. It's a structural analysis corresponding to
13 the same kind of questions that we ask when we do market
14 definition. You say, what is the relevant product?
15 Well, you need to know what matters. And that all seems
16 reasonable except that, oftentimes, when we try to do the
17 market definition formally, it's hard to pin down the
18 exact dimensions of the product market of the geography
19 because it's not always obvious. If products are
20 differentiated in many dimensions, it's not always
21 obvious the relative importance of various dimensions.

22 So, if you try to come up with a market
23 definition, you may well get stuck right there, unable to
24 show that there's a narrow enough market in which
25 concentration is high enough to warrant concern. And you

1 get knocked out of stage one before you even get to first
2 base. So, that's a problem.

3 Now, at the same time, in such cases, you may
4 well have suggestive direct evidence that those firms do
5 seem to compete pretty strong directly with each other
6 and lesser with other parties. That's sometimes
7 information that's called evidence of competitive
8 effects. I like to actually distinguish that. It's the
9 type of information -- you know, we see that they seem to
10 be bidding against each other a fair bit as compared to
11 others, but that doesn't quite tell us that there will be
12 competitive effects. We have a few more things to cross
13 before we get there.

14 But it's a different kind of information.
15 Enough to suggest that even though we may not be able to
16 define the market with any precision, which would have
17 tripped us up in stage one, we really ought to take a
18 hard look. So, in other words, the thing about it is, we
19 may not know why it is that Steve and I are strong
20 competitors, but there may be good evidence that we are,
21 at least good suggestive evidence. So, that's how I
22 think of this, too.

23 So, it makes sense to start there and say,
24 well, are there some fundamental underlying structural
25 factors, fundamental assets that do, in fact, validate

1 that these two firms are especially close and that other
2 firms couldn't step into the mix? It's important to not
3 stop with this suggestive evidence. It's important
4 because, one, there could be a lot of data problems with
5 win-loss and these kind of measures. And there's other
6 reasons that we could talk about later. And, so, I view
7 these as very complementary approaches. You look at the
8 suggestive evidence and then you try to understand is
9 there something fundamental that validates that? And
10 that second step requires basically the kind of stuff we
11 do when we do a market definition of concentration, I
12 think.

13 Now, let me just illustrate all of this -- like
14 I said, it sounds pretty obvious. Let me illustrate it
15 with a case study where I submitted a declaration. This
16 involved a proposed merger of two amphitheaters in
17 Southern California that -- these are open-air venues
18 that were mainly used to stage rock concerts in the
19 summer. So, this is the division trying to get the youth
20 vote. And we showed our hipness when we referred to Mr.
21 Rickie Lee Jones.

22 **(Laughter).**

23 MR. SCHWARTZ: For those who remember that.
24 Now, when I first looked at this case, there are so many
25 dots on the map of Southern California that were

1 potential venues, you had no idea what to do with this
2 stuff. How can there possibly be a case here? Well,
3 what's the relevant geography? Is it Orange County or is
4 it also Los Angeles? Not obvious a priori. Product
5 market. Concert venues are differentiated -- I've
6 written down dimensions -- by location, proximity to
7 freeways, availability of parking, noise restrictions,
8 size, outdoor versus indoor, general ambience. Lots of
9 stuff.

10 If you tried to define the market from first
11 principles, you would have been killed, right? There's
12 just not enough information there to get a strong market
13 presumption of a market definition and high
14 concentration. At the same time, picking up on what John
15 Baker says, let's see how they view each other, who do
16 they think they're competing with? There was just a
17 document that showed of all of the times when one
18 facility bid to attract an act, 90 percent of the time
19 they lost to the other guy. Well, that's interesting.
20 You could say there's something going on.

21 There were also documents suggesting that price
22 competition between those two was responsible for rock
23 groups getting a bigger percentage of the gate revenue
24 there than in other markets. So, all of this was
25 interesting and forced us to try and understand the why.

1 Look at the documents, talk to promoters, talk
2 to industry participants and pretty soon you got some
3 insight into this. It turns out that these venues were
4 very close. That mattered. Twenty miles as opposed to
5 40 miles matters in Southern California. They were
6 comparable size. Stadiums, for example, which were
7 50,000, are fine for the Rolling Stones but are not fine
8 for Mr. Rickie Lee Jones.

9 **(Laughter).**

10 MR. SCHWARTZ: The open-air nature mattered.
11 Furthermore, those attributes, once you understood why it
12 is these firms are uniquely close competitors are not
13 things that competitors could easily replicate. Try
14 getting a zoning variances in Southern California. All
15 of which gave me a fair bit of confidence that you've got
16 something.

17 Now, to supplement this and to put the market
18 definition concentration overlay, I actually did a
19 robustness check. Let's suppose that we include in the
20 geography also Los Angeles, what happens? Let's suppose
21 we include also closed-air facilities and under 5,000,
22 what happens? The concentration still remained quite
23 high. Now, if you included the stadium and you measured
24 your shares by -- when I say concentration, I meant by
25 revenues, how we measured it. When you use your capacity

1 as you measure, number of seats, well, yeah, it's diluted
2 because a couple of stadiums wipe out the concentration,
3 but that's not relevant because these are differentiated
4 products and just counting seats is not the right metric.

5 So, I give that as an example of how when we
6 think of unilateral effects and market definition,
7 there's an aspect to this, which is, there's different
8 kinds of information we tend to put under those buckets
9 and I think both of those are useful and they should both
10 be used.

11 So, let me just stop there and leave the rest
12 for Q and A.

13 MR. SHAPIRO: Thank you so much. That's a very
14 good example. Even a little dated, I think. But those
15 very issues come up all the time. So, thank you.

16 Next, I would like to turn to Renata Hesse.

17 MS. HESSE: So, I was going to actually try to
18 talk about Oracle without really talking about Oracle
19 because I think everybody's probably sick of hearing
20 about it, but it is something that both -- because I was
21 involved with it at the Division and also because I work
22 for technology companies a lot now, is a case I've given
23 a lot of thought to. And I have tried to figure out
24 precisely why it is that Judge Walker ended up where he
25 was, given that we thought it was pretty clear that these

1 two companies were very close competitors and that we had
2 a lot of evidence suggesting that that was the case.

3 So, I don't mean exactly how he got to the end
4 result because there's been a lot of discussion about
5 how, in some ways, that might have been a foregone
6 conclusion. But what I really mean is what, to me, is
7 problematic about the decision is this inherent tension
8 in it that he felt between how you define markets -- and
9 there's a lot in the decision that you can read about how
10 he was struggling with this idea of defining markets too
11 narrowly -- and the assessment of competitive effects in
12 the context of differentiated product markets where what
13 you're trying to focus on is figuring out whether or not
14 the products of the two merging firms are really next
15 best substitutes. In a sense, whether or not it's a
16 merger to monopoly for these two products. And I think,
17 in my view, Judge Walker ended up in a place that's not
18 particularly helpful because he defined a very narrow set
19 of cases where you could find a problem.

20 But what does that really have to do with the
21 guidelines? So, I think one of the things you can give
22 him credit for -- and obviously as a losing party, I'm
23 willing to give him credit for very few things -- but he
24 really was struggling for guidance. He was looking for
25 help with unilateral effects. And you can see, if you

1 read the opinion, that he read all kinds of economic
2 articles. The economists in the room might think he
3 didn't quite get them right, but he did look for
4 information.

5 And I don't think the guidelines gave him very
6 much help because they really don't say very much about
7 how to look at market definition and unilateral effects
8 in the context of differentiated product markets and they
9 really don't address the unique issues associated with
10 these two pieces that you're looking at, market
11 definition and competitive effects. And I think
12 everybody so far who's spoken has basically agreed in the
13 context of at least differentiated products, the analyses
14 really aren't very different. But the guidelines don't
15 really say very much about that. And, so, I think it
16 would be helpful to have more explication of how it
17 really works.

18 I guess in my view there are kind of two things
19 you can do. And I guess there's a third thing, which I
20 will start with, which is basically saying you don't need
21 you to define markets when you're looking at unilateral
22 effects in differentiated product markets. I think given
23 that the Supreme Court has basically said you have to
24 define markets, that's pretty much off the table. So,
25 despite the fact that that might be economically the

1 right thing to do, I'm not sure you can just mandate
2 through guidelines that you don't have to define markets.
3 I think people are going to continue until case law
4 changes.

5 So, once you're in the world of defining
6 markets, I think you've got two choices. And one is to
7 really understand and make more transparent that in the
8 context of differentiated product mergers and unilateral
9 -- I always get tongue-tied around this, unilateral
10 effects cases involving differentiated products, that the
11 market definition analysis is going to tend to lead to
12 much smaller and narrow markets and in many, many cases
13 may, in fact, lead to just two firm markets and that you
14 shouldn't be afraid of that. It's okay.

15 You can look at -- I think it's the Staples
16 decision where you sort of get the feeling that Judge
17 Hogan is like, I can't define this narrowly as a market,
18 I'll call it a sub-market and that will be okay. It's a
19 market. I mean, if you want to think about that as a
20 market in terms of competitive effects, it's a market and
21 we should let the world know that's all right, judges,
22 you can do that.

23 The other option I think is to continue to do
24 what I'll call sort of traditional market definition,
25 which will tell you, I think, something about market

1 dynamics, but it won't really give you very much insight
2 and it certainly won't tell you enough about what's going
3 on so that you can get into the world where you're
4 talking about presumptions. And if you go that route, I
5 think there has to be some explicit statement that that's
6 also okay.

7 By that, I think what I'm really talking about
8 is sort of a recalibration of how we think about market
9 definition in this context. So, if you define markets
10 narrowly, it may not be appropriate to label a firm
11 dominant, as Judge Walker said in Oracle. In a
12 traditionally defined market, the firm may have very low
13 market shares. In fact, that was what Judge Walker
14 thought was the case in Oracle.

15 Conversely, if you continue to define markets
16 more broadly, but then, in terms of thinking about
17 competitive effects, focus more uniquely on the
18 competitive interaction between the two firms, it may be
19 similarly inappropriate to say that the plaintiff, in
20 many cases the agency, that you failed to meet a
21 presumption and you don't have a prima facie case because
22 you don't have a structural case and the market is not
23 concentrated and, therefore, you can't go forward. And I
24 think there just has to be some acknowledgment that
25 these two similar, but different ways of thinking about

1 market definition in the context of unilateral effects
2 cases are different than what you're going to do in a
3 coordinated effects case, for example, but they really
4 are okay. They may seem a little bizarre at the
5 beginning, but they're actually, from an economic
6 perspective, correct and that courts and practitioners
7 shouldn't shy away from them.

8 So, there's a lot more to say about these
9 things, but I will pass the mic back to Carl.

10 MR. SHAPIRO: Thank you, Renata. We are going
11 to follow up on that, I promise you that. But not before
12 we hear from our last panelist, Steve Salop.

13 MR. SALOP: Thank you. I just want to say, as
14 I begin, this represents joint work that I'm doing with
15 my colleague, Serge Moresi, at CRA.

16 What I want to focus on today is really two
17 issues and a third if I've got time. The first is
18 downgrading the importance of market shares and
19 concentration in unilateral effects cases. I don't think
20 there's anything wrong with defining a market in
21 unilateral effects cases, though Mark Popofsky told us
22 this morning that both he and Judge Posner think that
23 Section 7 of the Clayton Act don't actually require that.
24 But rather whether or not we define a market, the issue
25 is the importance that we're going to place on market

1 share and concentration.

2 The second thing I want to talk about is
3 alternative presumptions, alternative evidence that we
4 can use in unilateral effects cases if we do downgrade
5 the role of market shares and concentration.

6 And then, third, if there's time, I want to
7 talk a little bit about deterrence and the role of
8 deterrence in the merger guidelines because it's
9 something I found that was left out of the questions and
10 is something that's really very important.

11 In the previous panel, with respect to market
12 definition, they talked about, gee, there's really a lot
13 of consensus about the SSNIP test, and I don't think
14 that's true. I think that there's not much consensus --
15 well, there may be a lot of consensus, but there's not
16 consensus on the SSNIP test, which implies unanimity. I
17 think there are real problems with the hypothetical
18 monopolist SSNIP test in the guidelines and I think that
19 it requires a lot of renovation that also indicates why
20 we should be downgrading the role of market shares.

21 The SSNIP test is really very elegant
22 methodology, but it's both complicated and very
23 imperfect. And as a result, it often leads to very
24 ambiguous results. Noisy evidence at best. You often
25 can't tell what market is most appropriate. And I think

1 the revised guidelines should explicitly concede this
2 point. It was made very nicely in a paper by Katz and
3 Shelanski. And it implies that the role of concentration
4 of market shares should be downgraded.

5 Now, we already know from Baker Hughes and
6 other cases that the Philadelphia National Bank
7 presumption has been weakened over the last 40 years, and
8 I think a key reason for that are the flaws in market
9 share and concentration as indicating competitive
10 effects. But, of course, it should be recognized, I
11 would say sort of it's interesting the ABA's comments to
12 the questions ignored the fact that if you weaken the
13 presumption, the Philadelphia National Bank presumption,
14 which they wanted to do, that implies that you would also
15 weaken the safe harbor presumption. And that door swings
16 both ways.

17 If market shares and concentration are an
18 unreliable measure of the likelihood of anti-competitive
19 harm so that they can't be used to create an anti-
20 competitive presumption, well, then they're flawed with
21 respect to the safe harbor presumption as well. And I
22 was quite taken by the fact on the previous panel that
23 Joe Simons, who is usually associated with the
24 conservative wing, is someone who thinks that that safe
25 harbor also should be downgraded.

1 With respect to market definition, I think
2 there are several areas in which the implementation of
3 the SSNIP test is very problematical. The first is the
4 smallest market principle, which I think should be
5 deleted. Most importantly, as a matter of policy, as
6 many other people have said, the fact there may not be a
7 problem in the narrowest market does not mean that
8 there's not a competitive problem in a broader market.
9 So, you simply can't stop with the smallest market.

10 Secondly, it can lead to a very distorted view
11 of competition by using this next best substitute
12 algorithm. I think the current guidelines fall for the
13 cellophane fallacy, despite the fact they recognize its
14 existence. This use of the prevailing price, unless
15 there's evidence strongly suggesting passive
16 coordination, I know of virtually no cases in which the
17 agencies have used a lower price. But tacit coordination
18 is pretty common and one should be very cognizant of the
19 potential for falling for the cellophane fallacy. And in
20 our comments, we suggest a way around it.

21 Third, margins may be high not because of tacit
22 coordinated but because of differentiated products. And
23 when products are differentiated, we think we should use
24 the Katz and Shapiro, and O'Brien, and Wickelgren
25 methodology that uses margins as an indicator of

1 elasticities, like the OFT is doing in their merger
2 guidelines.

3 Fourth, the SSNIP test is very complicated when
4 there are multi-product firms, either substitutes or
5 complements; very complicated when there are dynamic
6 effects and one cannot count on the simple-minded SSNIP
7 test to give a reliable answer. And to put multi-product
8 firms and dynamic competition into account in the SSNIP
9 test, you essentially have to do a simulation model that
10 simply eliminates efficiencies. Very complicated
11 analysis.

12 So, the point I want to make here is that
13 these are all reasons why the market definition process
14 is necessarily complex, imperfect and error prone.
15 Sometimes it's virtually intractable. While we may want
16 to define a market, because market definition is very
17 useful for getting an understanding of who the close
18 substitutes are, it says that we should be downgrading
19 the role of market shares and concentration. You don't
20 want to put too much weight on that.

21 So, what should we do in unilateral effects?
22 Well, I start from the idea that there's lots of evidence
23 that's relevant for unilateral effects besides market
24 shares. There's direct evidence from natural
25 experiments, such as Staples, you know, the kind of

1 evidence in Staples and Whole Foods. Sometimes there's
2 direct evidence of pricing interaction. Sometimes the
3 firms claim pricing interaction as did documents in both
4 Whole Foods and Staples. There's also circumstantial
5 evidence available of the closeness of substitution from
6 consumer switching evidence, from entry studies. A whole
7 variety of evidence that could be used to throw light on
8 closeness of substitutes.

9 I want to focus here on one particular type of
10 circumstantial evidence, these upward price pressure
11 indices of the sort that Alison was talking about and
12 that we talked about in detail in our comments, price
13 pressure indexes or PPis. And they can be either gross
14 upward price pressure indexes or net ones. Upward price
15 pressure and unilateral effects depends on the closeness
16 of substitution, which I think you can proxy by the
17 diversion ratio and the margin, as well as other
18 factors.

19 But the particular measure that looks at the
20 diversion ratio in the margin is very useful. It's
21 generally pretty simple to calculate and it can be used
22 as a presumption. It could be used to replace the HHI
23 that is the product of the market shares or the combined
24 market share.

25 There was a lot of anxiety expressed in the

1 ABA's comments about this upward price pressure index.
2 And it's funny for two reasons. One, I started
3 consulting around 1982 and clients were willing to pay me
4 a great deal of great money to calculate HHIs in 1982.
5 Lawyers were very uptight about the HHIs. But, now,
6 that's considered old hat. Anybody can do an HHI.

7 MR. SCHWARTZ: Those were the days.

8 MR. SALOP: Those were the days, yeah. But the
9 same thing with respect to the upward price pressure
10 index. In fact, it's not alien at all. The merger
11 guidelines -- I don't have the section. Maybe Carl can
12 find it. Talk about the next best substitute as defined
13 by the value of diversion. Well, I think the best
14 measure of the value of diversion is the diversion ratio
15 times the margin. That would be the proper analytic
16 measure. So, really in order to carry out the SSNIP test
17 in the merger guidelines, you already need to know this
18 upward price pressure index.

19 It's also not alien because diversion ratios
20 are basically the ratio of the cross elasticity rather to
21 the own elasticity and those elasticities have been
22 around in merger analysis since the DuPont and Brown Shoe
23 cases. Indeed, this upward price pressure index, the
24 gross price pressure index that Serge and I focused on in
25 our comments is a very close cousin to the market

1 definition test in Katz and Shapiro, and O'Brien, and
2 Wickelgren.

3 So, we think it's a really very useful bit of
4 circumstantial evidence. It's not direct evidence; it's
5 circumstantial evidence. But it's better circumstantial
6 evidence than looking at market shares. And it can be
7 used to form the presumption, either the safe harbor
8 presumption or the anti-competitive effects presumption.
9 In fact, it's very interesting because this index that we
10 use, the diversion ratio times the margin, in fact, it is
11 the market definition test if the hypothetical SSNIP is a
12 SSNIP for just a single product.

13 If it's a uniform SSNIP, then it's a little
14 more complicated. It's the diversion ratio times the
15 margin divided by one minus the diversion ratio, at least
16 in the simple form where everything's symmetric. So, it
17 is very closely related and it's a good way to think
18 about the presumption. I mean, suppose you propose a
19 market just of the products of the merging firms and you
20 find that an increase in the price of one of the products
21 would be profitable, so that those two products would
22 define a market.

23 Well, that seems like a pretty defensible
24 presumption of anti-competitive harm. Not a
25 nonrebuttable presumption because this is only using part

1 of the information, but it is a rebuttable presumption as
2 good as the HHI, as good as the combined market share, it
3 really seems much better. And then you can go with that
4 fairly simple presumption and then you can move on from
5 there and gather the additional evidence that you'd need
6 in order to evaluate the likelihood of anti-competitive
7 effect.

8 Do I have one more minute to talk about
9 deterrence?

10 MR. SHAPIRO: One minute.

11 MR. SALOP: One minute. You know, the
12 guidelines are really all about deterrence. They're not
13 all just about analyzing a single merger. The goal of
14 merger enforcement goes beyond analysis of the particular
15 mergers that happen to come before you. They also have
16 to take into account deterrence. We know there are false
17 positives and false negatives in merger analysis as in
18 anything else but deterrence goes beyond the false
19 positives and false negatives for the deals you have, but
20 also the effect on the deals that are being proposed.
21 And false negatives include insufficient remedies.

22 So, I think it's important in setting these
23 presumptions and working through the guidelines that you
24 figure out the impact on deterrence. Section 7 talks
25 about incipency. In 1960, that was about a trend to

1 concentration, but in the world of decision theory that
2 we're in now, what incipency must mean is a greater
3 concern about false negatives and under-deterrence, than
4 about out false positives and over-deterrence.

5 So, I hope that the agencies, in thinking
6 through the guidelines and in particular in deciding what
7 cases that you're willing to go to court over, that you
8 take the deterrence effects into account.

9 There's been a lot of talk in the last few
10 years about won/lost records. One, economics makes it
11 very clear that there's selection bias, that won/lost
12 records tell you virtually nothing about the litigation
13 because of settlement rates. And it seems to me, in
14 looking at sort of what people have been writing about
15 the last few years, that the agencies are paying too
16 close attention to won/lost rates and possibly are being
17 too risk adverse with respect to the cases they bring.

18 So, thank you.

19 MR. SHAPIRO: Thank you, Steve. Thank you,
20 all, for your comments.

21 There's a lot more to talk about and not that
22 much time. Let me frame, at least, my first set of
23 questions around the relevant section in the guidelines
24 that deals with lessening of competition through
25 unilateral effects and, in particular, differentiated

1 products which I have to say, in my experience, at least
2 the last eight months at being back at DOJ, that's a lot
3 of the cases. I can't give you a count, but it's a lot
4 of the cases, particularly intermediate goods where we're
5 seeing if suppliers are bidding for patronage of their
6 downstream business customers.

7 So, there's about two pages on this in the
8 guidelines, a page and a half. And I want to read --
9 bear with me -- after describing unilateral effects
10 generally what they are. And here's, I think, the main
11 guidance and, so, I want to push on where we would go
12 beyond that. It says, "Substantial unilateral price
13 elevation in the market for differentiated products
14 requires that there be a significant share of sales in
15 the market accounted for by consumers who regard the
16 products of the merging firms as their first and second
17 choices."

18 So, our staff is often looking at that
19 question, first and second choices, that's very closely
20 related to diversion ratios. But notice that it's framed
21 in terms of share of sales in the market. Okay?

22 Now, I want to set that in contrast -- now, you
23 can imagine some modifications there that wouldn't
24 necessarily refer to the market when doing that part of
25 the test. And I want to then bring in your example,

1 Marius, where you said you don't know what the market is,
2 you don't know what the boundaries are, you could look at
3 a win/loss record, you could look at bidding, you could
4 look at some other measures of how often the two firms
5 bump against each other. So, if you do that, and then --
6 but then Bobby Willig warned us this morning. He says,
7 well, careful, if you just look at the win/loss records,
8 you might be missing the fact that there's other firms,
9 let's say other venues in your case, that are almost as
10 good substitutes to the two merging venues and if you
11 ignore them and just looked at the direct competition,
12 you'd get a false positive.

13 So, Marius, starting with you, could we do
14 modest revisions here, for example, that would reflect
15 your iterative process, not assume you've figured out the
16 market yet to give guidance about how this actual
17 investigative process would work?

18 MR. SCHWARTZ: Okay. Can you make the question
19 a little more precise?

20 MR. SHAPIRO: What do you do next? After you
21 look and you see that the two -- they're often bidding
22 against each other, what do you do next to make sure that
23 you've paid enough attention to surrounding competition
24 even if you haven't defined the market?

25 MR. SCHWARTZ: I'll tell you what we did and I

1 think it's a good general lesson, is you try to
2 understand why it is that you're seeing this seemingly
3 close competition. So, you talk to people, you read
4 documents, decision documents, and try to pin down what
5 are those fundamental assets that might be driving this.
6 And it's important -- I agree with Bobby there, that if
7 there's no fundamental assets or anything that is
8 explaining this pattern, you ought to worry a little bit
9 because --

10 MR. SHAPIRO: You've got, obviously, your
11 locations and venue, physical properties in your case.
12 That's often the case. You have some pretty well defined
13 product attributes.

14 MR. SCHWARTZ: You have that, but if you don't
15 know how important those are -- somebody says, oh,
16 consumers would, at the drop of a hat, drive 30 more
17 miles. That blows me out of the water.

18 So, you need to try to get information on how
19 important these things are. And with that information,
20 you can come back and try to craft maybe a range of
21 candidate markets, all of which would show you if you've
22 done it right, that there's pretty high concentration.

23 Back to the point that if you're confident
24 there's a unilateral effect, there ought to be a market
25 there.

1 MR. SHAPIRO: I'm trying to get confident, I
2 guess, is the problem. I think M.J. said, well, if
3 you've figured out the unilateral effects, you can back
4 out the market. But how do we figure that out? If we're
5 not going to do it based on market shares, does that mean
6 we're doing the full competitive effects analysis? What
7 if we look at the bidding and maybe margins, is that good
8 enough or do I back out the margin from that or is that
9 too easy? Others?

10 MR. SALOP: This is a drafting issue, Carl. It
11 seems to me that the share of the sales accounted for you
12 should just interpret as the diversion ratio. The
13 importance of the other substitutes, as Alison pointed
14 out, they're all in the denominator. They're already
15 taken into account. You need to take the margin into
16 account.

17 It seems to me that Bobby's -- you know,
18 Bobby's example came from some testimony that Bobby gave
19 at the Antitrust Modernization Commission that said if
20 you've got two gas stations on a traffic circle that are
21 perfect substitutes and then you've got some other more
22 distant gas stations that are a little more distant
23 substitutes, I suppose the relevant market would be all
24 the gas stations, not just the ones on the circle, but
25 the merger involves the two gas stations on the circle.

1 So, if you raise the price at one of the
2 stations on the circle, all the sales would be diverted
3 to the other station. So, it would seem like there's a
4 unilateral problem, but, in fact, if they'd really try to
5 raise the price, people would go to the other stations.
6 And the conclusion is problematical because his example
7 doesn't hold together. If the two stations on the circle
8 were perfect substitutes, like he assumed, and if they
9 weren't colluding -- you definitely don't want to allow
10 the merger, if they were colluding. But if they weren't
11 colluding and they're perfect substitutes, they can keep
12 the price down to costs, the margin would be zero. So,
13 there would be no unilateral effects concern. So, the
14 example just doesn't work.

15 If you fix the example so they're
16 differentiated products, then this upward price pressure
17 index works just fine. If you'd raise the price at one
18 of the stations, some people would go to the other
19 stations and they would be protected, but the people that
20 didn't go to the other stations, they would get hammered
21 from the merger. So, you need to deal with unilateral
22 effect that could occur from raising only a single price.

23 It seems to me that the people that are worried
24 about the more distant substitutes -- I mean, clearly,
25 they need to come into account of a full analysis. But

1 the people that want us to say that trumps, they're
2 ignoring the fact that a unilateral effect can involve a
3 subset of the product's prices being raised, not a
4 uniform price increase. And that's the flaw in their
5 reasoning.

6 MR. SHAPIRO: So, let me pick up on that and
7 materiality. Alison, I know you mentioned this, but you
8 don't have to respond if you don't feel like it.

9 One notion of materiality would be there's
10 going to be a significant price increase and how do we
11 know about that? Another would be, well, it's maybe not
12 just a product or two, does that really count? If
13 there's two guys that sell two different brands of
14 breakfast cereal, but there are a whole different set of
15 cereals that are offered and we think the price of one or
16 both of those brands will go up a bit, but they're just
17 two of many, is that enough under -- you know, should
18 that be enough? What might we say about that
19 materiality, either magnitude or scope of the price
20 increase?

21 My sense is some judges might say, look, that's
22 a sub-market or that's a narrow part of a market. That's
23 not enough. Reaction? Alison?

24 MS. OLDALE: I have to say I don't have an
25 answer at all. I've got more questions on materiality.

1 I'm really not sure what I have to say about it. I think
2 probably the best characterization of the way that we've
3 tended to think about it in the UK is in terms of the
4 size of the price increase rather than the volume of
5 products that are affected in relation to the size of the
6 market. But it's not clear to me that either of those
7 are right. Should we care more about bigger markets? Is
8 there some notion of materiality being related to this
9 size of the consumer detriment arising? I think it's an
10 important and under-explored area.

11 MR. SHAPIRO: Go ahead.

12 MR. SALOP: Well, if you take this gas station
13 example, if the only people that would be hurt would be
14 the people that stayed and you only thought a small
15 portion of the consumers would stay with the first gas
16 station, but there are efficiencies that apply to, you
17 know, large efficiencies that apply to all the customers,
18 then you might say it's immaterial. That's because,
19 okay, if 10 percent of the consumers that buy the two
20 products are going to be harmed, but the other 90 percent
21 are going to benefit, then you might say that's not
22 material. So, I'd say it's always relative to the
23 efficiency benefits that you expect in the market.

24 MR. SHAPIRO: Renata, this is sort of directed
25 at you, but, again, I'm not trying to put anybody on the

1 spot too much. You said we should say it's okay to have
2 narrow markets. But there's certainly a sense that if
3 the markets seem narrower than courts are likely to be
4 comfortable with that they'll, at least, raise eyebrows,
5 and I'm sure you experienced that when you were at DOJ.

6 And you mentioned Oracle and since many of us
7 know that, maybe it's good for illustrative purposes. I
8 mean, strictly speaking, if you said, okay, if there's a
9 unilateral effect between Oracle and PeopleSoft, then
10 they could be a market, the two of them, without even
11 including SAP. That would be somehow the logical
12 conclusion, at least if they were next closest
13 substitutes, which is kind of an artifact anyhow. So it
14 seems -- and I should add, the commentary gives a lot of
15 language about how these markets that we get could
16 exclude a lot of products that are substitutes for some
17 customers. It's the same idea.

18 Should we import in language from the
19 commentary? If we're going to go that route, of course,
20 if we're convinced that's right as a matter of analysis,
21 we'd like to make the argument for the courts either in
22 the guidelines or case by case. Are you just telling us
23 to be brave or what?

24 MS. HESSE: Maybe so. I mean, I think,
25 obviously, the challenge is that you have these cases

1 sitting out there and so you now have to do something
2 about them. And, so, in my view, one of the biggest
3 priorities that you all should have is actually finding a
4 good differentiated products case where you can try to
5 fix what's wrong in Oracle. And that's not an easy thing
6 to do. But I think the guidelines, at the very least,
7 could give --

8 MR. SHAPIRO: Are some of your clients going to
9 offer us a good opportunity?

10 MS. HESSE: I'm hoping not. Could offer some
11 more explanation for how this really works and why the
12 narrow market isn't something that you should be afraid
13 of. For me, personally, I think actually the other route
14 is preferable because I think it's a more true reflection
15 of what the overall market dynamic is.

16 MR. SHAPIRO: What do you mean by that?

17 MS. HESSE: Meaning that you look at the market
18 and you don't define it as just Oracle and PeopleSoft,
19 you define it as Oracle, PeopleSoft and SAP and the
20 shares of Oracle and PeopleSoft are lower, they don't
21 meet the structural market concentration Philadelphia
22 National Bank presumptions.

23 But you could say, okay, this is what the
24 market looks like. But if you look at the competitive
25 interaction between these two parties, we've identified a

1 significant number of customers who account for a
2 significant proportion of the sales in the market who
3 will be harmed. And we can show that to you in a variety
4 of different ways, merger simulation, customer testimony,
5 documents from the parties, et cetera.

6 MR. SHAPIRO: What about the other way to go, I
7 imagine, would be to say even if the SSNIP markets are
8 fairly narrow and aligned with unilateral effects, as you
9 said, we could plead broader markets either by abandoning
10 the smallest market principle, using a bigger SSNIP or
11 whatever, and then we might have relatively small market
12 shares and argue, well, these market shares understate
13 the effect because the two firms are selling products
14 that are very close and we see them against each other a
15 lot. Then we'd be up against arguments, oh, the market
16 shares are so small, you guys are wrong, okay, and that's
17 sort of a safe harbor.

18 Were you going to pick up on that?

19 MS. MOLTENBREY: Yes.

20 MR. SHAPIRO: I thought you were.

21 MS. MOLTENBREY: I think it's difficult, I
22 guess, to think about this partly the way an economist, I
23 think, would think about it and the way a lawyer would
24 think about it, which are not necessarily identical,
25 especially if you're not a lawyer who was raised as an

1 antitrust lawyer.

2 I think all of us, all of the lawyers in this
3 room who do this every day, are relatively comfortable
4 with economic models and looking at econometrics as a way
5 to define markets and to say it doesn't matter that in an
6 industry where the firms identify one another as -- you
7 know, maybe identify five or six firms as their big
8 competitors, look at them, respond to them.

9 Nevertheless, there is a market that consists of only two
10 of those firms. In fact, you know, when we think about
11 it accurately we may say there are probably multiple
12 markets within that industry, all of which are relevant
13 for antitrust purposes and all of which could be
14 appropriate.

15 But as lawyers when we think about how we're
16 going to present a case and you think about case law, the
17 precedents you're going to be looking at and the fact
18 that you may well be in front of a judge who maybe does
19 two or three difficult antitrust cases in their entire
20 career, that's not really a very attractive way to think
21 about markets. The challenge, I think, in the
22 guidelines, is going to be to find a way to explain why
23 this localized competition is what you're going to be
24 focused on, but not in a way that makes it seem as though
25 everything else that's happening out there is irrelevant.

1 If you sit there and say, a merger between --
2 and I'm not suggesting agreement or disagreement with any
3 of these particular cases, but if you look at the Whole
4 Foods/Wild Oats case, for example, and you say
5 competition between Whole Foods and Wild Oats is very
6 important and this merger is going to eliminate this
7 localized competition and prices are going to go up, it
8 doesn't follow from that that the other supermarkets in
9 the relevant geographies are irrelevant. It doesn't mean
10 that the importance of another supermarket is basically
11 no different than the importance of the dry cleaner down
12 the road. Obviously, that's not how the agencies are
13 thinking about it.

14 So, I think the challenge is to find a way to
15 reconcile those two things. Some of it may be about
16 language. When I started at the Antitrust Division back
17 in the mid-eighties, to date myself, it was a time period
18 when if you actually used the word "sub-market" when
19 talking about things, you were immediately chastised and
20 ridiculed and kind of sent back to your office to write
21 1,000 times, there is no such thing as a sub-market. And
22 that comes out of the misuse of the concept of sub-
23 markets in the courts and in some older cases.

24 But I'm not sure that that isn't possibly a
25 useful way to talk to a non-antitrust specialist about

1 why we care about a merger between two firms, even though
2 there are other competitors in a market. Maybe there are
3 other ways, if people are too afraid of reintroducing
4 some of the abuses that you have from sub-markets and the
5 notion of talking about localized competition or
6 something. But, to me, that's really an expositional
7 problem; it's not an analytical problem.

8 But it is an important part of what the
9 guidelines do, is to help courts understand exactly what
10 it is and, frankly, lawyers and practitioners who may not
11 be as facile with some of the economic concepts to have
12 this make sense to them.

13 MR. SHAPIRO: We're --

14 MR. SALOP: Can I just make a comment about
15 that? I think that what M.J.'s saying that's really very
16 wise is that Philadelphia National Bank and sub-markets
17 were crutches and they're crutches that have turned out
18 now, you know, 40 years later, to get in the way of
19 getting the right result.

20 And, so, if you'd go back and abandon
21 Philadelphia National Bank and just take a competitive
22 effects approach, a first principles approach and come up
23 with credible evidence that there's harm, irrespective of
24 the presumptions, and then bring in the presumptions in a
25 secondary way, we win even if there are no presumptions,

1 but by the way, there ought to be a presumption, maybe
2 not based on market share, maybe based on a price index,
3 then that's the way to do it.

4 MR. SHAPIRO: Let me pick up on that with that
5 last question and we will go just a few more minutes.
6 So, we heard earlier today from the first panel -- the
7 first two panels, actually, this morning that presumption
8 isn't so strong anyhow and agencies need to tell a
9 convincing story of effects to convince a judge that
10 customers will be harmed. That was the way Rich Parker
11 put it, for example.

12 So, in unilateral effects cases, the guidelines
13 don't really get into what categories of evidence are
14 convincing or probative or we look to. There's a bunch
15 of ones that I can list. I just want to very quickly
16 have people say, do you think the guidelines should get
17 into talking about some of these categories of evidence
18 or is that too much detail, for example? So, there's
19 win/loss reports, bidding episodes, other indicia of
20 head-to-head competition. One can look at margins. You
21 can look at shares of some collection of products,
22 customer surveys, company documents, merger simulation at
23 the high end, it's more sophisticated, hard to understand
24 maybe.

25 What about listing some of these and how we

1 look at them and what role they play, would that be
2 helpful or too much detail? Let's go down sort of very
3 quickly each person.

4 MR. SCHWARTZ: I think without being taxonomic,
5 listing a few and saying that, yeah, we take them
6 seriously, especially because they give a window to how
7 the participants view the competition, that would be
8 helpful. That's how I'd approach things. So, why not
9 list it?

10 MR. SHAPIRO: Yeah, Steve.

11 MR. SALOP: I think some categories would be
12 useful. In fact, there are categories -- in the market
13 definition section, there's a categorization of types of
14 evidence. I think you certainly should have in that list
15 natural experiments because that's really key.

16 MR. SHAPIRO: M.J., just going down.

17 MS. MOLTENBREY: Yeah, I agree.

18 MS. HESSE: I'm against listing actually. In
19 part because I think there are some markets and some
20 industries where some of these tools don't work very
21 well, and, so, if you list them out, people are going to
22 feel like, oh, my god, what if I can't do a merger
23 simulation and I don't have win/loss?

24 From the outside, people look at these lists
25 and they think, okay, I can check off these boxes. And

1 the other reason is that I actually think that it's
2 always some combination of these things. And they're
3 informative and I guess you can list them in a win and
4 say these kinds of things can be informative.

5 MR. SHAPIRO: So, if we said -- and I think
6 this is the way it's done in other parts of the
7 government -- here are the types of things that we look
8 at, each case is different, you might have none of these
9 or some of them, it all depends, these are just
10 instructive, would you still be pretty uneasy with that,
11 Renata?

12 MS. HESSE: I think what you're going to end up
13 doing is driving people towards specific kinds of
14 evidence.

15 MR. SHAPIRO: And that's bad?

16 MS. HESSE: Yes, I mean, I think because it
17 could be -- yes.

18 MR. SHAPIRO: Alison, do you want to weigh in
19 on this or not?

20 MS. OLDALE: A couple of things. I think
21 there's possibly a difference between listing types of
22 evidence and types of tools. So, evidence may be a bit
23 more durable than tools. I have the impression that
24 our tools are evolving all the time as we get better at
25 what we do and they may not last 20 years or however long

1 it is between revisions of guidelines in quite the same
2 way.

3 I have to say, our guidelines do contain quite
4 a lot of lists. But I've heard quite a lot of arguments
5 today that maybe the guidelines ought to focus on the
6 more durable bits and some of the lists should be perhaps
7 in commentary, which I'm going to take away and think
8 about.

9 MR. SHAPIRO: Well, your draft is quite a bit
10 longer than our guidelines, for example.

11 MS. OLDALE: Yes. Yeah, it is much longer.

12 MR. SHAPIRO: For better or worse. Okay,
13 I know I'm imposing on you a little bit. We are
14 slightly past time, but let me give each panelist up to a
15 minute, if they want, to leave us with a last pearl of
16 wisdom.

17 MR. SCHWARTZ: I'll take less than a minute. I
18 just suggest to Carl, it may be a good idea if the
19 agencies released a draft of the proposed guidelines so
20 we can look at the actual language and maybe have a
21 second round, at the risk of creating more work.

22 MR. SALOP: I just think you should put a page
23 limit on the guidelines.

24 **(Laughter).**

25 MS. MOLTENBREY: I think you should do

1 everything you can to avoid putting any Greek letters
2 into the guidelines, but other than that...

3 MS. HESSE: So, as my prior comment indicated,
4 I think I am in favor of more general but explanatory
5 information, use of hypotheticals, maybe along the lines
6 of the merger commentary, but not a lot of real detailed,
7 specific information.

8 MS. OLDALE: And I just think that you have a
9 challenge. There seems to be quite a common view about
10 what we actually do and what we ought to be doing for
11 unilateral effects, but also a very common view that
12 trying to express this in the existing framework for the
13 way that we do market definition is quite difficult.

14 MR. SHAPIRO: Well, thank you all. Join me in
15 thanking the panel.

16 **(Applause).**

17 MR. SHAPIRO: So, we're going to adjourn until
18 Tuesday when we're in New York.

19 **(Panel 4 concluded.)**

20 **(The workshop was adjourned.)**
