Instructional videos were created to assist nursing students struggling with learning the steps for evidence based practice (EBP). Three separate video modules were produced to explain each of the steps in the EBP process using Microsoft Office Mix. In order to easily distribute the information to students a website was created using Weebly. Tabs for each of the major steps in the EBP process are listed on the site to assist better understanding of how to search for necessary information.

Under the PICO METHOD tab there are 3 videos on how to use this method to:

- Formulate a searchable clinical question
- A self-assessment that can be completed after watching the videos
- An article on the PICO method from Bernadette Melnyk who is an expert on EBP in nursing

EBP spans all levels of preparation in nursing so students from the first professional degree, masters and doctoral programs in the school of nursing are accessing important information on this website to support their learning. This type of content delivery allows students to go at their own pace. It can also supplement face to face instruction or be part of an online course. Moreover, the EBP process is not likely to undergo major changes so creating a website where basic information can be housed and accessed anywhere there is an internet connection is a more efficient and practical way to use your teaching resources within your school.
