THE FOLLY OF EXPECTING EVIL:
RECONSIDERING THE BAR’S CHARACTER AND FITNESS REQUIREMENT

Leslie C. Levin*

* Nothing is so wretched or foolish as to anticipate misfortunes.
What madness is it to be expecting evil before it comes.1

INTRODUCTION

The bar’s character and fitness requirement is based on the largely untested premise that an applicant’s past history helps predict whether that individual possesses the moral character needed to be a trustworthy lawyer. The primary purpose of the character inquiry is to protect the public and the judicial system from potentially problematic lawyers.2 The inquiry may also signal to the public that lawyers possess “good character” and deserve to be trusted with their important legal matters, thereby facilitating client representation and the administration of justice.3 An alternative—and more critical—characterization of this purpose is that it is designed to protect the legal profession’s reputation in order to promote the profession’s autonomy and its monopoly on the provision of legal services.4

1. LUCIUS ANNAEUS SENECA, EPISTULAE Morales ad Lucilium C. 65 AD.
As part of the character inquiry, bar authorities review information provided by bar applicants, law schools, and other sources relating to, \textit{inter alia}, an applicant’s academic history, criminal background, employment and financial history, and mental health.\footnote{5} They use this information to determine whether the applicant possesses the present character and fitness required to practice law.\footnote{6} The assumption is that “from evidence of past misconduct, bar examiners will be able to predict future behavior accurately enough to justify denying the applicant the chance to practice law.”\footnote{7} As a practical matter, very few bar applicants are denied admission on character and fitness grounds.\footnote{8}

There is no shortage of critiques of the character and fitness inquiry.\footnote{9} Perhaps the most troubling is the absence of evidence that the inquiry actually protects the public by excluding applicants from the bar who will become problematic lawyers. Of course, it is impossible to prove what might have happened if individuals were not required to demonstrate good character as a condition of bar admission. Perhaps the very few applicants who are denied bar admission would have caused great harm if they had been admitted to practice. Other people with problematic personal histories who are deterred by the character inquiry from even applying to law school may have engaged in misconduct if they had been admitted to the bar. It is also possible, however, that some people who would have become good lawyers are deterred from applying

\footnote{8}. Only about one applicant per year is denied admission in Colorado. Colo. Supreme Court, Office of Attorney Regulation Counsel, \textit{Annual Report} 29 (2013), \url{https://www.coloradosupremecourt.com/pdfs/Regulation/2012%20Annual%20Report.pdf}. The estimated denial rates in Connecticut are 1–2 people (0.14%) per year. Telephone Interview with R. David Stamm, former Executive Director, Connecticut Bar Examining Committee (Jan. 8, 2008). Denial rates in some other states range from 0.18–1%. See \textit{Mo. Bd. of Law Exam’rs, Frequently Asked Questions (FAQs), \url{https://www.nble.org/faq#360}}; Supreme Court of Ohio & the Ohio Judicial System, \textit{Character and Fitness Determinations}, \url{http://www.supremecourt.ohio.gov/AttySvcs/admissions/cfstats/default.asp} (last visited Sep. 26, 2014); see also \textit{Rhode, supra} note 4, at 516 (reporting that in the 1980s, 2% of applicants were denied bar admission on character and fitness grounds).
because of concerns that they would not be able to satisfy the character and fitness requirement.\textsuperscript{10}

Another shortcoming of the character and fitness inquiry is that it is grounded in moral philosophy and in intuitions about human behavior—and not in psychological research. Indeed, “moral character” is an idea rooted in the philosophy of virtue ethics rather than in psychological concepts.\textsuperscript{11} Virtue ethics posits that good character runs deep in those who possess it and is based on a combination of an individual’s virtues and the exercise of practical judgment.\textsuperscript{12} Its orientation is normative. Research shows, however, that even “good” people lie—to themselves and to others.\textsuperscript{13} Most are dishonest at times, depending upon the circumstances and with whom they interact.\textsuperscript{14}

Psychological research has also shown that personality—and not “character”—correlates with certain patterns of conduct. Personality can be distilled into five broad factors (e.g., Conscientiousness, Emotional Stability, etc.),\textsuperscript{15} and some of those factors appear to be correlated with ethical behavior. Yet personality alone does not determine who will engage in unethical behavior. Factors leading to unethical choices at work are multi-determined by individual characteristics, the characteristics of the moral issue, and the organizational environment.\textsuperscript{16} Thus, it may be impossible to predict at the time of bar admission which applicants will become problematic lawyers.

The psychological research is consistent with sociological research, which indicates that the workplace strongly affects lawyers’ ideas about professionalism and how lawyers should conduct themselves in

\end{enumerate}
practice. Indeed, lawyers often look to their “communities of practice,” that is the “groups of lawyers with whom practitioners interact and to whom they compare themselves and look for common expectations and standards.” Lawyer conduct is not only affected by other lawyers they observe, but by, inter alia, office size, client resources, and client demands. These factors typically do not come into play until after the character and fitness inquiry occurs.

Thus, the character inquiry at the time of bar admission has uncertain value, yet it imposes some significant costs. For example, the inquiry into past criminal conduct may perpetuate racial and class biases, as people of color and the poor are subjected to disparate treatment in the criminal justice system. The inquiry into a bar applicant’s psychological history can be highly intrusive and deter some law students from seeking psychological help. The process itself is costly and time consuming for applicants, especially if they are required to undergo a hearing. The process can also become embarrassing, stressful, and career-damaging for applicants who must explain to employers why their bar admission is delayed.

Only two published studies have sought to explore whether the information gathered during the character and fitness inquiry predicts who will later be disciplined. The first study looked at the information collected by the Minnesota State Board of Law Examiners during the bar admission process and at subsequent lawyer discipline. Although the

Superior Court (May 18, 2010) (on file with author).
22. See infra notes 78-80 and accompanying text.
24. Carl Baer & Peg Cornuelle, Character and Fitness Inquiry: From Bar Admission to
study results suggest that there is a relationship between certain pre-
admission conduct and subsequent discipline, it was not a rigorously
designed study.\textsuperscript{25} A more recent study of Connecticut lawyers indicates
that the information gathered during the character and fitness inquiry is
of little use in predicting who will subsequently be disciplined.\textsuperscript{26}

Of course, the fact that the information revealed during the character
and fitness inquiry does not strongly predict who will be a problematic
lawyer does not mean that the inquiry is entirely without value. The
inquiry is also thought to serve symbolic functions: it communicates to
the public that lawyers are to be trusted, and conveys to lawyers that they
are expected to conduct themselves in a responsible and trustworthy
manner. If these are the main reasons for conducting the inquiry,
however, it may be that the inquiry could be considerably streamlined so
that it is less burdensome for applicants and does not deter those who
might be good lawyers from applying to the bar.

This article looks at the empirical evidence to consider whether the
bar’s character and fitness inquiry should be continued as currently
constituted and if not, what changes should be explored. Part I of the
article briefly describes the history of the character and fitness
requirement and outlines the inquiry as currently conducted. Part II
discusses some of the critiques of the inquiry, focusing primarily on the
absence of evidence that the information elicited through the inquiry
predicts future misconduct and on the reasons to question whether the
information collected would be useful predictors of misconduct. It also
highlights some of the costs associated with the inquiry. Part III explores
what the psychological research reveals about the difficulty of predicting
certain types of behavior. It also looks at the limited research available
about which behaviors seem to predict problematic behavior in the
workplace. Part IV discusses what can be learned from a study of
Connecticut lawyers about the predictive value of the information
obtained during the character and fitness inquiry. The study reveals that
some of the information obtained very weakly predicts who might be
later disciplined, but that even with rigorous statistical modeling, the
predictive power of that information is very low. Moreover, the reasons
why certain variables weakly predict discipline may have less to do with

an individual’s “character” than with other factors. Part V considers whether the character inquiry should be continued as currently constituted. Is it folly to continue with a process that assumes (incorrectly) that bar applicants who report certain problem histories are likely to engage in future misconduct? In light of evidence that only a very small number of people are ever excluded from the bar, and the limited predictive value of the character inquiry, the inquiry should only be conducted in an abbreviated form. The article concludes with some suggestions for additional research to better determine which aspects of the character inquiry should be continued. It also considers some alternatives for protecting the public from potentially problematic lawyers.

I. THE MORAL CHARACTER AND FITNESS REQUIREMENT

A. History

The moral character requirement as a condition of bar admission pre-dates the Revolutionary War. In the early years of the republic, many states required that bar applicants demonstrate good moral character. It was only in the late nineteenth century, however, that efforts began in earnest to inquire systematically into the character and fitness of bar applicants. This took place within the broader context of the professional project, that is, the legal profession’s efforts to attain market monopoly, social status, and autonomy. It also coincided with an influx of immigrant lawyers, which fueled the bar’s efforts to raise admission

27. In 1707, Maryland’s Governor Seymour stated that no person shall be admitted to practice “untill they have previously undergone an Examination of their Capacities honesty and good behaviour before us . . . .” Alan F. Day, Lawyers in Colonial Maryland, 1660-1715, 17 AM. J. LEGAL HIST. 145, 146 (1973). In Virginia, persons desiring a law license in the 1740s were required to produce “a certificate from some county court, or other inferior court . . . of his probity, honesty, and good demeanor.” ANTHONY HERMANN CHROUST, I THE RISE OF THE LEGAL PROFESSION IN AMERICA 275 (1965) (quoting WILLIAM WALLER HENING, 5 THE STATUTES AT LARGE; BEING A COLLECTION OF ALL THE LAWS OF VIRGINIA FROM THE FIRST SESSION OF THE LEGISLATURE IN THE YEAR 1619 345 (1819)); see also GERARD W. GAWALT, THE PROMISE OF POWER: THE EMERGENCE OF THE LEGAL PROFESSION IN MASSACHUSETTS 1760–1840, 10 (1979); CHARLES WARREN, A HISTORY OF THE AMERICAN BAR 26–43 (1966).

28. See W. Raymond Blackard, Requirements for Admission to the Bar in Revolutionary America, 15 TENN. L. REV. 116, 121–23, 125 (1938) (describing good moral character or “integrity” requirements in Pennsylvania, Rhode Island, and New Jersey); GAWALT, supra note 27, at 60. In the 1840s, a few states eliminated all requirements for bar admission except a good moral character requirement. LAWRENCE M. FRIEDMAN, A HISTORY OF AMERICAN LAW 236–37 (3d ed. 2005).

standards. Richard Abel has noted that as the number of immigrants increased and “their sons sought to become lawyers, the profession tried to preserve its homogeneity and superior social status by requiring citizenship and imposing ‘character’ tests.”

Nativist and ethnic prejudices during the 1920s and economic pressures during the Great Depression fueled renewed calls for barriers to entry to the legal profession and resulted in efforts to stiffen “character” screening. By raising admission standards through formal legal education requirements, bar examinations, and the character and fitness inquiry, the bar sought to signal that lawyers possessed the technical expertise and moral fiber to be viewed as a profession and to be entrusted with legal work.

By 1928, virtually all of the states had a character and fitness requirement for bar admission. The National Conference of Bar Examiners (“NCBE”) was formed in 1931 with the aim of “raising . . . the standards both as to knowledge of the law and fitness of character of those who are to become future members of the bar.” Character inquiries often relied on letters of recommendation, on the publication of names of applicants seeking admission, or on interviews of applicants. A few states used character questionnaires which asked for information still sought on modern bar applications, such as prior residences, prior employment, and disciplinary history during college.

As character inquiries grew more probing, they were increasingly used to scrutinize—and sometimes exclude—bar applicants. Some applicants were denied admission because of their actual or suspected ties to the Communist party. The character requirement was also used

31. Abel, supra note 4, at 6; see also Rhode, supra note 4, at 499 (observing that “the initial impetus for more stringent character scrutiny arose in response to an influx of Eastern European immigrants, which threatened the profession’s public standing.”).

to exclude some applicants for conscientious objection to military service. Applicants were subjected to extended character inquiries due to sexual orientation and lifestyle choices, such as cohabitation. In the 1970s, bar examiners began to regularly inquire into mental health history and soon thereafter, bar applicants were sometimes denied admission on that basis.

B. The Current Requirement

Every state and the District of Columbia conduct character and fitness inquiries as a condition of bar admission. Although this inquiry begins in some jurisdictions during the first year of law school, the official character and fitness inquiry typically begins at the end of law school, when an applicant applies for bar admission. It is usually conducted by a bar examining authority (or a character and fitness committee) that operates under the supervision of the state court. Applicants complete a lengthy questionnaire that asks for detailed information about past conduct and produce substantiating documentation such as criminal records, credit histories, driving records, and character references. Law schools also provide information about their graduates’ conduct and academic performance. The information is then reviewed by the bar examining authority for completeness and for any information that might reflect adversely on the applicant’s character. A character and fitness hearing may be triggered by, inter alia, academic misconduct, prior unlawful conduct, misconduct in employment, neglect

42. See *In re Ronwin*, 680 P.2d 107 (Ariz. 1983); *In re Martin-Trigona*, 302 N.E.2d 68 (Ill. 1973); *Bauer*, supra note 9, at 103.
44. As a practical matter, the character screening process begins when law schools inquire about an applicant’s personal history in their applications. See Dzienkowski, *supra* note 10, at 923. Certain misconduct may lead to denial of admission to law school. See Linda McGuire, *Lavering or Lying? When Law School Applicants Hide Their Criminal Histories and Other Misconduct*, 45 S. TEX. L. REV. 709, 727 (2004).
45. See *supra* note 5 and accompanying text.
of financial responsibilities, substance dependency, and evidence of psychological problems.\textsuperscript{46} In a few states, felony convictions are automatically disqualifying, at least for a period of time.\textsuperscript{47}

Bar applicants bear the burden of proving that they possess the requisite good character for admission to the bar.\textsuperscript{48} The criteria for demonstrating good character in the bar application process are, however, unclear. Good character is not directly defined by the NCBE, although it is manifested by a record of conduct that “justifies the trust of clients, adversaries, courts and others.”\textsuperscript{49} A record revealing a significant deficiency in “honesty, trustworthiness, diligence, or reliability” may constitute a basis for denial of admission.\textsuperscript{50}

What do bar examining authorities actually consider when assessing an applicant’s character and fitness to practice law? The moral character inquiry seeks to determine “whether the present character and fitness of an applicant qualifies the applicant for admission.”\textsuperscript{51} The concern is whether the applicant, if admitted to practice, is likely to engage in wrongdoing. Bar examining authorities look at a variety of factors including, \textit{inter alia}, the seriousness and recency of any misconduct, the cumulative effect of the conduct, and evidence of rehabilitation.\textsuperscript{52} Lack of candor during the character inquiry—rather than the past misconduct itself—is a common reason for denial of admission.\textsuperscript{53} Applicants who fail to express remorse or take responsibility for their past misconduct often face difficulty gaining bar admission.\textsuperscript{54}

\section*{II. SOME CRITIQUES OF THE CHARACTER AND FITNESS REQUIREMENT}

Deborah Rhode’s wide-ranging critique of the bar’s character and fitness inquiry appeared almost thirty years ago, but remains relevant.

\textsuperscript{46} COMPREHENSIVE GUIDE, supra note 2, at viii.
\textsuperscript{47} Id. at 4–6.
\textsuperscript{48} See, e.g., \textsc{state bar rules mich.} R. 15(1)(15) (2013) (“An applicant has the burden of proving by clear and convincing evidence that he or she has the current good moral character and general fitness to warrant admission to the bar.”); \textit{In re Payne}, 715 S.E.2d 139, 140 (Ga. 2011); \textit{In re Brown}, 928 N.E.2d 445, 447 (Ohio 2010); \textit{In re Nash}, 739 N.W.2d 71, 74 (Iowa 2007).
\textsuperscript{49} COMPREHENSIVE GUIDE, supra note 2, at viii. Some states have attempted to articulate additional conduct and qualities that reflect good moral character, although they are also quite general. See, e.g., \textsc{CONN. PRACTICE BOOK} §2-5A (a) (2014), http://www.jud.ct.gov/Publications/PracticeBook/PB.pdf.
\textsuperscript{50} COMPREHENSIVE GUIDE, supra note 2, at viii.
\textsuperscript{51} Id. at viii–ix (emphasis added).
\textsuperscript{52} Id. at ix; \textsc{Stone}, supra note 9, at 364–66.
\textsuperscript{53} See \textsc{Clemens}, supra note 3, at 299–301; Rhode, \textsc{supra} note 4, at 535, 544.
\textsuperscript{54} See \textsc{Clemens}, supra note 3, at 289; Hoener, \textsc{supra} note 9, at 842–46; Rhode, \textsc{supra} note 4, at 545; \textsc{Simon}, supra note 3, at 1008, 1012–14.
today. At that time, she described the inconsistent and subjective application of the character and fitness standards. As she also observed, “the courts and examiners involved in certification have failed to confront the large volume of social science research that questions both the consistency and predictability of moral behavior.” She further argued that the bar’s character and fitness inquiry cannot reasonably be expected to prevent admission of “problem” lawyers because “the current process is both too early and too late.” The inquiry occurs “too early” because it occurs before applicants have encountered the situational pressures of practice. It is “too late” because it occurs after applicants have invested thousands of dollars (now often more than $100,000) in their legal education, making it harder for bar authorities to deny admission to applicants who have invested three years in law school and have often incurred substantial student loan debt.

The argument that the character and fitness inquiry comes “too early” to predict which applicants might become “problem” lawyers also finds support in the discipline statistics. The most common recipients of lawyer discipline are middle-aged males. These disciplined lawyers often report depression related to work or life circumstances, alcohol abuse, or family or financial crises. Their problems with their marriages, their mortgages, and other life circumstances often arise years after the character and fitness inquiry occurs.

Moreover, practice setting strongly affects the likelihood of discipline, and this, too, is often not known until after the character and fitness inquiry occurs. Lawyers in solo and small firm practice receive over 90% of all discipline, even though they make up less than 50% of

55. Rhode, supra note 4, at 529–32, 538–44.
56. Id. at 556.
57. Id. at 515.  
58. Id.
59. Of course, not all lawyer misconduct is detected or subject to discipline. Nevertheless, discipline appears to be the best available measure of lawyer misconduct. See Levin et al., supra note 26, at 9.
all practicing lawyers. The reasons for this are complex. Disciplined lawyers tend to work in personal plight areas such as criminal law, family law, and personal injury. Their clients are often emotional and vulnerable. Unlike larger firm clients, who are repeat players in the legal system, the clients of solo and small firm lawyers may have no recourse against their lawyers except for the discipline process. Moreover, solo and small firm lawyers often work in offices with inadequate administrative support, which can result in neglect of client matters—a common reason for discipline. Discipline authorities may also find it easier to pursue complaints against these lawyers because the cases are less complex and the lawyers are less likely to hire counsel to defend themselves.

The argument that the character inquiry occurs too early to determine how an individual will behave in practice is further supported by studies suggesting that lawyers’ behavior is significantly affected by office colleagues and firm culture. This is due, in part, to the fact that the psychological pressure to conform to the behavior of a group is powerful. Lawyers often learn their responses to ethical challenges early in practice from other lawyers around them. Client resources and demands also shape lawyers’ views and behaviors. Again, these factors do not come into play until after the character inquiry occurs.

The character and fitness inquiry has also been criticized on other grounds. Less affluent individuals may have more problematic credit histories than more affluent applicants and may therefore encounter more difficulty with bar admission. Questions about arrests, convictions, and traffic violations may disproportionately and adversely affect minorities, who tend to fare more poorly in the justice system due to racial profiling, discrimination, and the lack of counsel. Potential law school applicants

73. See Fortney, supra note 20, at 990–94.
are concerned about revealing this information on law school applications. This concern may deter some individuals who would otherwise be good lawyers from pursuing the law as a career.

Questions on the bar application about prior diagnosis of or treatment for psychological disorders have also engendered considerable criticism. The criticism mostly focuses on the breadth and intrusiveness of the questions, which in some jurisdictions inquire about any psychological diagnosis or treatment over an extended time period. Commentators and others have questioned the predictive value of such questions, especially when those who have been previously treated for a psychological disorder may be more likely to address those problems successfully than those who have not sought treatment.

The character and fitness inquiry has other costs. The process is costly for applicants, who must pay for the character inquiry as part of the bar admission process and must also pay to obtain certain records required by bar authorities. It is time-consuming, as applicants must often track down official records and other information going back ten or more years. If an applicant is required to produce additional

78. In some states, the charge for the character and fitness inquiry is combined with the fee for taking the bar examination. In other jurisdictions, it is separate. For example, Arizona applicants pay a separate $300 fee for a “Character Report.” Schedule of Fees and Filing Deadlines, AZCOURTS.GOV for Admission to the Practice of Law in Arizona (Jan. 1, 2012), http://www.azcourts.gov/Portals/26/admis/2012/Miscellaneous/2012FeeSchedule.pdf. Fees for filing the Illinois Character and Fitness Questionnaire range from $100 to $450, depending upon when the questionnaire is submitted. Information for First and Second Year Law Students, ILL. BOARD OF ADMISSIONS, https://www.iilbaradmissions.org/appinfo.action?id=2 (last visited Aug. 26, 2014).

79. When I asked a non-random sample of law students how long it took them to complete
information or attend a hearing, the monetary and psychological costs associated with the process are significant. In some cases, the hearing process may delay or jeopardize employment if the applicant must disclose to an employer why she has not yet been admitted to the bar. These are significant costs associated with a process that is thought to protect the public—with scant evidence that it actually does so.

III. PREDICTIONS OF FUTURE MISCONDUCT

Psychologists working from a variety of perspectives—e.g., cognitive, evolutionary, moral, personality, and social—are seeking to answer the question of what causes individuals to behave unethically. As it turns out, this is an enormously complicated question. There is significant disagreement about the mechanisms involved in ethical decision making: For example, does it involve prior reasoning and reflection, or moral intuitions that are justified after the fact? The factors that affect the resolution of ethical issues are also complex. Unsurprisingly, predictions about future unethical behavior can be even more difficult.

Some psychologists have attempted to predict behavior based on personality characteristics. Personality is measured by five broad factors—Agreeableness, Conscientiousness, Emotional Stability, Extraversion, and Openness to Experience—that are linked to certain patterns of conduct. These factors seem to remain fairly consistent during adulthood. Conscientiousness, in particular, is thought to be predictive of behavior in the workplace. Individuals exhibiting high Conscientiousness tend to be hard-working, reliable, organized and scrupulous. Low Conscientiousness has been found to be the best predictor of counterproductive work behaviors, such as theft and rule

---

80. See supra notes 22–23 and accompanying text. In some cases, the costs include hiring a lawyer to represent them.

82. See, e.g., Kish-Gephart, supra note 16, at 17-18.

83. COMPREHENSIVE HANDBOOK, supra note 15, at 153.

84. Id.; Saul Fine et al., Is Good Character Enough? The Effects of Situational Variables on the Relationship Between Integrity and Counterproductive Work Behaviors, 20 HUM. RESOURCE MGMT. REV. 73, 74 (2010).

violations. Yet personality characteristics alone do not predict misconduct in the workplace. Other individual factors (e.g., demographics), social and interpersonal factors, and organizational factors predict counterproductive work behaviors.

Criminologists have also attempted to explain the factors that contribute to deviant behavior. They, too, have found that deviance seems to be determined by time-stable personal characteristics, social bonds, and other situational factors. For example, poor self-control—which correlates with a cluster of personal characteristics—has been found to be significantly related to the commission of certain offenses such as drunk driving and theft. Yet opportunity and perceived risks and rewards also significantly affect the intention to offend. Certain life events also influence behavior and modify trajectories. Job stability and strong marital attachments predict large negative effects on alcohol use and general deviance, at least in early adulthood. This is true both for individuals who have a prior history of delinquency and those who do not.

In light of substantial evidence that the factors influencing behavior are multi-determined, it is not surprising that attempts to predict certain behavior, even by trained clinicians, have met with only mixed success. Efforts to predict violence by psychologists and psychiatrists based on clinical judgment are not especially accurate. Predictions based on human judgments by a wide range of “experts” (e.g., psychiatrists, college counselors, judges, etc.) are often less reliable than those based...
on simple algorithmic models. Of course, predictions about future conduct may be improved as we learn more about human behavior. For example, researchers are exploring whether certain behaviors, such as academic cheating, predict deviant behavior in the workplace. They have found that students who engage in academic dishonesty in college are significantly more likely to engage in unethical behavior in clinical settings, engage in workplace dishonesty, or to otherwise violate the policies of their professional workplaces. Academic dishonesty also correlates with measures of risky driving behaviors, high alcohol intake, illegal behaviors, and personal unreliability. Most of the studies have been limited to undergraduate students, although a few have looked at graduate students.

Some professions have also sought to explore through other means whether it is possible to predict who will engage in problematic behavior in the workplace. For example, pre-employment psychological testing has been administered to police officers for more than eighty-five years. Certain personality measures on the California Psychological Inventory relating to the Conscientiousness factor seem to predict dysfunctional job behaviors by law enforcement officers. Individuals who engaged in certain dysfunctional behaviors such as marijuana use, driving under the influence, and conduct resulting in military court

martials prior to becoming law enforcement officers had a higher probability of subsequent discipline than law enforcement officers who did not engage in such behaviors. Discrepancies, inconsistencies, or omissions by individuals when supplying life history information (e.g., criminal activity, drug use, etc.) prior to being hired also significantly differentiated disciplined and never-disciplined law enforcement personnel.

The medical profession is also seeking to determine whether it is possible to predict who will be a problem doctor. Maxine Papadakis et al. looked at the medical school records of 235 graduates disciplined by state medical boards and compared those records to a control group. They found that disciplinary action by a medical board was strongly associated with prior unprofessional behavior reported in supervisors’ narratives during medical school. A different retrospective study of internal medicine residents found that residents with either low professionalism ratings on their Resident’s Evaluation summary or a low score on the internal medicine certification examination had nearly twice the chance of being subsequently disciplined by a state licensing board as their colleagues. Nevertheless, because most residents who performed poorly were not subsequently disciplined, unprofessional behavior during residency was only “a weak signal for the rare event of disciplinary action.”

IV. THE PREDICTIVE VALUE OF THE CHARACTER AND FITNESS INQUIRY

Little is known about whether any of the individual factors that are considered during the U.S. character and fitness inquiry—e.g., prior criminal history, academic misconduct—are relevant to the question of who will subsequently engage in misconduct as a lawyer. The character and fitness questions are largely based on intuitions that certain past

106. Id. at 2679–80. Disciplinary action was less strongly associated with low MCAT scores and poor grades during the first two years of medical school. Id. at 2680.
108. Id. at 874.
behavior indicates that the applicant poses a significant risk that he or she will engage in future misconduct. But with the possible exception of substance dependency, which has a significant relapse rate, or certain serious untreated psychological conditions, there is little empirical evidence that the past problems will continue. Nor is there evidence that prior problem behavior (e.g., traffic violations, poor credit history) predicts that the individual will engage in future misconduct that will harm clients or the public.

Only two published studies have sought to explore whether there is a relationship between bar applicants who disclose “problem” history during the bar admissions process and the lawyers who are later disciplined. Based upon a review of fifty-two Minnesota attorneys’ records who had been disciplined from 1982 through 1990 and bar admissions files, Carl Baer and Margaret Corneille found that applicants who disclosed problematic histories in their bar applications were four times more likely to engage in professional misconduct than other applicants. They also concluded that disciplined lawyers were more likely to reveal evidence of certain types of misconduct in their admissions files (e.g., employment termination, possible substance abuse, etc.) than other bar applicants. They did not report on the likelihood that an applicant with a prior history of misconduct would be subsequently disciplined. As Corneille later noted, “the study was not conducted scientifically and involved a very small sample.”

A more recent study of Connecticut lawyers examined the relationship between the information gathered by the Connecticut Bar Examining Committee (“CBEC”) during the bar admissions process and subsequent lawyer discipline. The study included all 152 lawyers admitted to the Connecticut bar from 1989 through 1992 who had been subsequently disciplined. Additional lawyers admitted to the Connecticut bar from 1989 through 1992 who had never been disciplined were randomly selected from a population of approximately 6,000 lawyers. The final sample for the regression analysis totaled 1,343 lawyers. Approximately 2.4% of all Connecticut lawyers admitted from 1989 through 1992 were disciplined through 2009. The average length of time between admission and the filing of a grievance leading to a discipline sanction was 10.7 years. Among the disciplined lawyers, 58

114. Id. at 15.
(38.16%) were severely disciplined and 94 (61.84%) were less severely disciplined.\textsuperscript{115}

At the time of bar application, there were some notable differences between the lawyers who were subsequently disciplined and those who were not. Male lawyers were disproportionately disciplined compared to female lawyers.\textsuperscript{116} Lawyers who were disciplined were more than twice as likely to report having had a pre-application psychological diagnosis/treatment as those who did not (4.1% vs. 1.9%). They were also more than twice as likely to report having had a pre-application criminal conviction (5.6% vs. 2.1%), having had their driver’s license suspended (13.1% vs. 5.4%), having had delinquent credit accounts (23.8% vs. 7.2%), and having attended a law school ranked in the bottom half (59% vs. 36.8%).\textsuperscript{117} At the same time, none of the disciplined lawyers reported bankruptcy on their applications, although four of the never-disciplined lawyers had previously declared bankruptcy.\textsuperscript{118} The rates of substance dependency and treatment did not significantly vary between the disciplined and never-disciplined groups.\textsuperscript{119} There were no reported instances of mental health diagnosis/treatment or substance dependency/treatment among those applicants who would go on to receive severe discipline. Instead, it was the less severely disciplined group which was significantly more likely to reveal a higher rate of mental health issues (6.7% vs. 0%, p<.05).\textsuperscript{120}

Logistic regression analysis revealed that gender has a statistically significant effect (p<.01) on the probability of being disciplined: being male increases the probability of being disciplined by 2.5 percentage points as compared to being female.\textsuperscript{121} Certain other variables also affected the likelihood of discipline, but only modestly. Compared to graduating from law schools ranked in the bottom half, graduating from the top half of law schools reduces the probability of discipline by 1.7

\textsuperscript{115} Id. at 11. “Severely” disciplined lawyers were suspended from practice for two or more years, disbarred, resigned and waived the right to reapply in response to charges of serious misconduct, received interim suspensions of indeterminate length, or were placed on disability/inactive status due to serious misconduct. “Less severely disciplined” lawyers received lesser sanctions, including shorter suspensions, reprimands, and conditions such as probation. Id.

\textsuperscript{116} While 16.6% of the disciplined lawyers were female, 40% of the entire lawyer sample was female. Id. at 9, 12–13. The overrepresentation of men among the disciplined lawyers is consistent with other studies of lawyer discipline. See, e.g., Debra Moss Curtis & Billie Jo Kaufman, \textit{A Public View of Attorney Discipline in Florida: Statistics, Commentary, and Analysis of Disciplinary Actions Against Licensed Attorneys in the State of Florida from 1988-2002}, 28 NOVA L. REV. 669, 691–92 (2004); Hatamyar & Simmons, supra note 60, at 786, 800.

\textsuperscript{119} Id.

\textsuperscript{120} Id. at 20.

\textsuperscript{121} Id. at 16.
percentage points and is statistically significant (p<.01). Higher law school grades are negatively associated with discipline risk (p<.01). Each additional thousand dollars of student debt raises the probability of discipline by 0.04 percentage points (p<.01). Having delinquent credit accounts increases the likelihood of discipline by about 2.7 percentage points (p<.01). A prior criminal conviction is associated with roughly 1.1 percentage points greater chance of discipline, but was not statistically significant. Traffic violations were associated with a higher discipline risk, with each additional violation adding slightly—about 0.4 percentage points—to the likelihood of discipline, and this effect was statistically significant (p<.01).

Finally, a prior mental health diagnosis/treatment was associated with a higher discipline risk. The effect was 2.2 percentage points and weakly significant (p<.10), but only for less severe discipline. It should be noted that an applicant with a record of mental health diagnosis/treatment is still very unlikely to be disciplined; the probability of discipline for someone with no mental health diagnosis/treatment is only 2.4%, so having such problems only raises the probability of discipline to about 5%.

Efforts to create a statistical model based on admissions data to predict which applicants would subsequently be disciplined were unsuccessful. In an effort to create such a model, a predicted probability of discipline for each lawyer was calculated by feeding the values of all the variables into an estimated regression equation. If the model estimated a probability of discipline greater than 50%, it was treated as a prediction of discipline. The model correctly predicted all of the 1,198 non-disciplined lawyers. But it correctly predicted only two of the 145 (1.38%) disciplined lawyers. Thus, when all the admissions data were used in a statistically rigorous fashion, the model yielded only two more correct predictions of who would be disciplined and no more correct predictions of who would not be disciplined.

The Connecticut study indicates that some factors known to the bar

128. Id. Six of the twenty-nine lawyers who reported a mental health diagnosis or treatment when they applied to the Connecticut bar were subsequently disciplined (all less severely). None indicated on their bar applications that their psychological condition was serious (e.g., involved a hospitalization). Id. at 27–28.
129. See id. at 19.
authorities at the time a bar candidate applies for admission are associated with a greater chance that the applicant will subsequently be disciplined. But the baseline probability of discipline is so low that even a factor that more than doubles this probability—say, from 2.4% to 5%—has little predictive power.130 Bar examining authorities would be unlikely to take significant action based on a predicted probability of future discipline as low as 5%.

It is not clear why certain variables predict discipline. For some variables, the answer may have less to do with moral character than with other demographic and social factors.131 The rank of the applicant’s law school—which predicts less severe discipline—provides one example. The law school attended affects students’ career options.132 Lawyers who graduate from top-tier schools are more likely to go to large firms; lawyers who graduate from lower-tier schools are more likely to work in solo and small firms.133 Solo and small firm lawyers are more likely to be disciplined, and lawyers in such settings are often disciplined for relatively low-level violations (e.g., neglect of client matters, failure to return phone calls) that may be due to inadequate office support.

The results indicating that bar applicants with delinquent credit accounts or with higher student debt load are more likely to be disciplined may have a similar explanation. Delinquent account holders may have problems managing their paperwork or may not take their legal obligations seriously. Such traits might also lead to lawyer discipline. An alternative explanation, however, is that these bar applicants may come from less affluent backgrounds.134 Graduates of elite law schools are more likely to come from more affluent backgrounds.135 These

130. More than 40 years ago, Alan Dershowitz anticipated the difficulty of trying to use statistical information to predict which law students would become disciplined lawyers when the base rate of discipline was so low. Alan M. Dershowitz, Preventive Disbarment: The Numbers Are Against It, 58 A.B.A. J. 815, 817 (1972). He was especially concerned about false positives. Id. at 817–18. The Connecticut study data also raise this concern. For instance, applicants with a problematic credit history were slightly more likely to be disciplined, but the vast majority of applicants with a problem credit history were not disciplined. Levin et al., supra note 26, at 13. Denial of admission to bar applicants with a problem credit history would almost inevitably result in excluding applicants who would not have become problematic lawyers.

134. Levin et al., supra note 26, at 27.

135. See Heinz et al., supra note 132, at 65.
individuals may need to incur less student debt than other applicants. Those with a problematic credit history or greater student debt may come from less affluent backgrounds, and therefore may be more likely to attend local or lower-tier law schools. This, in turn, tends to funnel them towards working in solo or small law firms, where discipline is more likely to be imposed.

The Connecticut study relied exclusively on information that was available to the CBEC when it made its admissions decision, and that information may not fully reflect an applicant’s true history. While some of this information could be verified (e.g., through Dean’s Certificates, traffic records, and credit reports), some applicants may have failed to reveal other hard-to-discover history. For example, some applicants with a history of substance dependency may not have revealed this information on the bar application.136 None of the applicants’ files revealed discipline for academic misconduct, which is surprising in light of the reported rates of cheating in academic settings.137 Thus, the Connecticut study only reflects the predictive value of the information that is known to bar authorities and not the predictive value of all information pertaining to applicants’ histories.138

V. RECONSIDERING THE CHARACTER AND FITNESS INQUIRY

There are enough questions about the value of the character and fitness inquiry to merit reconsidering the wisdom of continuing the inquiry as currently constituted. One approach might be for bar examiners to redouble their efforts to obtain more complete information about certain factors (e.g., academic misconduct, substance dependency) that they think might predict later misconduct, and to test whether those factors more strongly predict misconduct than the current research suggests. Given the low incidence of discipline (2.4%), however, it seems unlikely that even if bar examiners obtained complete information

136. The Connecticut study did not show that applicants with a history of substance dependency were more likely to be disciplined. It is noteworthy, however, that only about 1% of the Connecticut bar applicants reported substance dependency or treatment. During roughly that same time period, approximately 3.8% of law students reported using alcohol on a daily basis and .8% reported daily use of illicit drugs. Report of the AALS Special Committee on Problems of Substance Abuse in Law Schools, 44 J. LEGAL EDUC. 35, 41 (1994).

138. The study also only reveals the predictive value of the information with respect to lawyer discipline and not all lawyer misconduct. The reason why this limitation does not appear significant is discussed infra notes 143–47 and accompanying text.
about bar applicants’ histories, it would increase the predictive value of the information so greatly that it would merit denying admission to any particular individual on public protection grounds.

This raises at least two questions: First, if the character inquiry excludes very few applicants and the information obtained during the character inquiry only weakly predicts who will later be disciplined, should the inquiry be continued? And second, if the character inquiry is continued, should it be continued in its current form? In order to answer these questions, it is necessary to look more closely at the purposes of the character inquiry and to ask how well the inquiry serves those purposes. It is also necessary to consider what research might be needed concerning the relationship between actual past conduct (i.e., applicants’ complete histories) and future behavior, and what alternative measures might be taken to protect the public.

A. The Purposes Reconsidered

It is ironic that bar applicants bear the burden of demonstrating that they possess good character in the continued absence of reliable evidence that the character and fitness inquiry seeks information that identifies who will become a problematic lawyer. Indeed, there appears to be a negative relationship between some of the prior conduct asked about on bar applications (e.g., bankruptcy) and subsequent discipline.139 Of course, lawyer discipline systems do not detect or sanction all lawyer misconduct—they miss or ignore a lot of it.140 For instance, the overbilling of clients is not uncommon, but it is also not easy to detect.141 Legal malpractice actions may be adjudicated or settled without a discipline sanction. Conflicts of interest handled through disqualification motions in court rarely result in the additional imposition of lawyer discipline sanctions.142 Lawyers sometimes engage in misconduct that

139. See supra note 118 and accompanying text.
140. Discipline authorities have limited investigative resources and typically rely on complaints to learn of misconduct. See Lisa G. Lerman, A Double Standard for Lawyer Dishonesty: Billing Fraud Versus Misappropriation, 34 HOFSTRA L. REV. 847, 891 (2006). Some rule violations are ignored. Fred Zacharias, What Lawyers Do When Nobody’s Watching: Legal Advertising as a Case Study of the Impact of Underenforced Professional Rules, 87 IOWA L. REV. 971, 996 (2002). Certain disciplinary complaints are routinely diverted elsewhere or are simply not taken seriously. For example, fee disputes involving overreaching may be referred to mediation or arbitration programs. See Leslie C. Levin, The Case for Less Secrecy in Lawyer Discipline, 20 GEO. J. LEGAL ETHICS 1, 18 n.115 (2007). Discipline complaints filed by prisoners or complaints arising out of litigation are often viewed with skepticism by discipline authorities. See id. at 18.
142. See Richard E. Flamm, Looking Ahead to Ethics 2015: Or Why I Still Do Not Get the
benefits their clients (e.g., misrepresentations), but may be undetected by others. It is therefore possible that the character and fitness variables predict types of misconduct that are not typically the subject of discipline.

This seems unlikely, however, because the lawyer misconduct identified above is not materially different from the conduct for which lawyers receive disciplinary sanctions. For example, malpractice actions are often based on neglect, which is a common reason for discipline. Lawyers who engage in conflicts of interest outside the courtroom receive discipline sanctions. Lawyers who deliberately overbill clients are disciplined, as are lawyers who make misrepresentations to benefit their clients when their misconduct is detected. Thus, although it is possible that the character inquiry seeks information from applicants that predicts types of misconduct that do not result in discipline sanctions, there is presently no evidence that it does so.

Nor is there evidence that the character and fitness process protects the public from lawyer misconduct. As noted, very few applicants are refused admission to the bar on character and fitness grounds. Those who are denied admission are sometimes given leave to reapply and later successfully do so. Others who are denied admission in one

143. See Mather & McEwen, supra note 64, at 68. In addition, some lawyers sued for malpractice also receive disciplinary sanctions. See, e.g., In re Moak, 71 P.3d 343, 350 (Ariz. 2003); In re Cohen, 8 P.3d 429, 431–32 (Colo. 1999); In re Behnke, 537 N.E.2d 326, 327 (Ill. 1989).

144. See, e.g., Florida Bar v. Brown, 978 So. 2d 107 (Fla. 2008); In re Coleman, 273, 276 (1999).

146. See, e.g., Florida Bar v. Head, 84 So. 3d 292 (Fla. 2012); In re Galloway, 293 P.3d 696 (Kan. 2013).

147. It must be noted, however, that at least one type of lawyer misconduct so infrequently results in discipline sanctions that the Connecticut study sheds no light on whether the misconduct could be predicted by information available at the time of bar admission. Violations of the lawyer advertising rules are rarely the subject of discipline. See Zacharias, supra note 140, at 996. It seems unlikely, however, that bar applicants would be denied admission even if there were predictive information in their admissions files about their likelihood of engaging in this misconduct, because the advertising rules are not of great concern to regulators.

148. The possibility cannot be discounted that if all lawyer misconduct could be detected, a stronger relationship might be found between certain information revealed during the bar application process and subsequent lawyer misconduct. There is no way to test this empirically.

149. See supra note 8 and accompanying text.

150. For example, during the period from 1993–2005, only 12 of the 47 applicants who were denied admission to the Ohio bar on character and fitness grounds were barred from reapplying. Supreme Court of Ohio, supra note 8. My review of the cases and bar records revealed that some of the Ohio applicants who were initially denied admission subsequently reapplied and were admitted

123
jurisdiction are sometimes admitted elsewhere. Admittedly, the few individuals who are denied admission to any bar may have done some very bad things if they had become lawyers, but this is impossible to prove. It is also conceivable that the mere existence of the character inquiry protects the public by deterring some people with problematic histories from attending law school due to concerns about gaining bar admission. Those who are deterred might have caused serious harm as lawyers. Conversely, they might have become good lawyers with great empathy for their clients. How they would have fared as lawyers is simply not known.

Another argument for the character inquiry on public protection grounds is that it subjects bar applicants with problematic pre-application histories to close scrutiny, thereby placing them on notice that they must comport themselves in a manner consistent with the highest professional values. Whether this experience with the character inquiry positively affects subsequent lawyer conduct is unclear. A confidential study of Florida bar applicants who were conditionally admitted to practice—primarily because of mental health or substance abuse issues—revealed that they were disproportionately likely to be disciplined over the next ten years. These conditionally admitted lawyers were aware to the Ohio bar.

151. In the Connecticut study, three applicants who were asked to participate in character and fitness hearings elected not pursue their Connecticut applications. Each of them was already admitted to another bar or was subsequently admitted in another jurisdiction. See Leslie C. Levin et al., A Study of the Relationship Between Bar Admissions Data and Subsequent Lawyer Discipline, LSAC GRANTS REPORT SERIES 4 n.20 (2013), available at http://www.lsac.org/docs/default-source/research-(lsac-resources)/gr-13-01.pdf.

152. One such individual is arguably Matthew Hale, a white supremacist who was denied admission to the Illinois bar largely because of his virulently racist views and because he had “dedicated his life to inciting racial hatred for the purpose of implementing those views.” Comm. on Character & Fitness for the Third Appellate Dist. of the Supreme Court of Illinois, In re Hale (Ill. 1998), as reprinted in THE LAW AND ETHICS OF LAWYERING 875, 884 (Geoffrey C. Hazard, Jr. et al. eds., 3d ed. 1999). He was subsequently arrested for soliciting an FBI informant to kill a federal judge and sentenced to a 40-year prison term for that crime. Hale Convictions Upheld, CHICAGO TRIB., May 31, 2006, at 12; John Kass, Arrest Shrinks Hater Down to Size, CHICAGO TRIB., Jan. 9, 2003, at 2. It is impossible to know, however, whether Hale would have pursued a different path if he had been admitted to the Illinois bar.

153. Conditional admission in Florida is primarily reserved for applicants who disclose problems with substance abuse or mental health issues. FLORIDA BAR ADMISSION R. 3-22.5 (b).

154. FLORIDA BOARD OF BAR EXAMINERS, CHARACTER AND FITNESS COMMISSION, FINAL REPORT TO THE SUPREME COURT OF FLORIDA 30 (2009), available at http://www.floridasupremecourt.org/pub_info/documents/2009_FBBE_Character_Fitness_Report_Short_Version.pdf (citing Chad W. Buckendahl et al., Predicting Disciplinary Problems Using Character and Fitness Issues of Florida Bar Applicants). For example, of the 20 lawyers conditionally admitted in Florida 1998, four (20%) were subsequently disciplined and of the 24 lawyers conditionally admitted in 1999, six (25%) were subsequently disciplined. Id. The rate of discipline among this group is significantly higher than the 2.4% discipline rate among Connecticut lawyers and is higher than any other known discipline rate.
that they were being monitored for part of this period and yet some still engaged in misconduct. It is unclear, however, whether their misconduct was more likely to be detected, and these lawyers were more likely to be disciplined, because they were being monitored as conditionally admitted lawyers. Moreover, in some cases the discipline was imposed for failure to comply with the conditions of admission, such as routine drug monitoring, rather than for misconduct that is typically the subject of lawyer discipline. 155 Nevertheless, the study suggests that at least some of these individuals were not deterred from misconduct by the fact that they underwent close scrutiny during the character and fitness process. 156

One other public protection rationale for the character and fitness inquiry is that it serves a signaling function to lawyers by affirming shared values: it communicates that lawyers are expected to possess good moral character when they enter the profession and maintain it throughout their careers. 157 Again, it is difficult to test the impact, if any, of the character inquiry on lawyers’ attitudes toward their duty to behave ethically after they enter practice. Even if the character inquiry serves a positive signaling function at the outset of lawyers’ careers, many other factors—including office colleagues, client demands, concerns about reputation, and the threat of sanctions—have a powerful impact on lawyer conduct once they begin practice. 158 Assuming that the character inquiry conveys a message to lawyers with any staying power, it is unclear that the inquiry must take its current form in order to signal to lawyers that they are expected to behave ethically.

In addition to protecting the public, the character and fitness inquiry may also serve other functions. For example, it may signal to the public

156. See In re Roberts, 721 So. 2d 283 ( Fla. 1998). The Florida study also raises the possibility that the bar examining authorities were correctly identifying some applicants who were likely to later engage in misconduct. Unfortunately, without knowing more about the reasons why the conditionally admitted lawyers’ misconduct was detected or why they were sanctioned, it is not possible to determine whether this was the case. Efforts to obtain access to the study from Florida authorities have been unsuccessful.

158. See Leslie C. Levin, Immigration Lawyers and the Lying Client, in LAWYERS IN PRACTICE, supra note 19, at 87, 103–04; Mather & Levin, supra note 19, at 4, 14, 16; supra notes 17–19 and accompanying text. Other lawyers, in particular, can profoundly affect the ethical behavior of new lawyers shortly after they enter practice. See Levin, supra note 63, at 362–65.
that lawyers and the justice system can be trusted, thereby facilitating lawyer-client relations and encouraging respect for the courts. The character inquiry may also enhance the reputation and image of lawyers, thereby encouraging the public to use lawyers and advancing the professional project.  

It is difficult to assess to what extent the character and fitness inquiry promotes public trust in lawyers or a positive view of the legal profession more generally. The public’s views of lawyers are, at best, ambivalent. A 2009 Gallup Poll revealed that only 25% of the public had a positive view of the legal profession. A more recent poll found that only 20% of respondents rated the honesty and trustworthiness of lawyers as “high” or “very high.” It is unclear what the public actually knows about the bar’s character and fitness requirement or whether its existence affects the public’s views about lawyers. If the public were aware of the weak predictive value of the information considered during the character inquiry, the low number of applicants who are rejected on character and fitness grounds, or the fact that former felons are sometimes admitted to the bar, it is far from clear that the process would contribute to a positive public perception of lawyers. Moreover, even if the character and fitness inquiry contributes in some way to public trust in lawyers, this does not mean that the character inquiry as currently constituted is required to instill that trust.

B. The Process Reconsidered

Notwithstanding the absence of evidence that an applicant’s pre-application history strongly predicts future misconduct, it would be foolhardy—and probably futile—to argue for the complete elimination of the character inquiry. It seems unlikely that any profession or

---

159. See supra note 29 and accompanying text.

163. See, e.g., In re J.A.S., 658 So. 2d 515 (Fla. 1995); In re A.T., 408 A.2d 1023 (Md. 1979).

164. Thirty years ago Rhode raised the possibility of eliminating the character and fitness inquiry and dealing with problematic lawyers through the discipline process. Rhode, supra note 4, at 585, 589. She viewed the appropriate question to be “whether resources now consumed in predicting professional misconduct would be better expended in detecting, deterring and redressing it.” Id. at
regulatory body would license individuals who, at the time of application, are incarcerated for serious crimes or hospitalized for incapacitating psychological disorders. Yet the current character inquiry appears to be an ineffective method of determining who else should be denied admission to the bar. This section offers some thoughts about additional research that might shed light on who will become a problematic lawyer. It considers alternatives to the current character inquiry given the limited evidence that information collected during the inquiry actually predicts who might become a problematic lawyer. It also identifies some other measures that might be implemented to increase protection of the public.

1. Additional research

If bar applicants are going to be required to bear the burden of rebutting negative presumptions about their “character” based on their past histories, fairness dictates that there must be some demonstrated connection between applicants’ pre-application histories and the likelihood of future misconduct. While the Connecticut study indicates that some prior conduct predicts future discipline, these pre-application variables only increase the likelihood of discipline by a few percentage points. Additional study is needed to determine whether any of the information sought during the character inquiry more strongly predicts discipline than the Connecticut study suggests.

For instance, the Connecticut study revealed that never-disciplined lawyers were somewhat less likely to report prior criminal convictions at the time of bar admission than disciplined lawyers (2.1% v. 5.6%). Although this difference only raises the likelihood of discipline by a few percentage points, the finding merits further study. The CBEC relied primarily on applicants’ self-reporting of criminal convictions: It did not independently check bar applicants’ criminal records. During the period 1989–1992, Connecticut bar applicants may not have disclosed all of their criminal convictions—including their juvenile records and expunged records—because they may have believed that they were not required to do so. In order to better assess the true predictive value of

590. At that time, she noted that eliminating the inquiry was not unproblematic and that the lawyer discipline process was highly flawed. Id. at 585, 589–91. Today, the lawyer discipline system still fails to detect or sanction much misconduct. Levin, supra note 60, at 7 n.29. In any case, there is no political will to eliminate the character and fitness inquiry at this time.

165. See Levin et al., supra note 26, at 13.

166. Even though all jurisdictions ask about prior criminal convictions, some bar applicants believe that they do not need to reveal juvenile offenses or criminal convictions that have been expunged. See McGuire, supra note 44, at 717–18; Tim Gallagher, Note, Innocent Until Proven Guilty? Not for Bar Applicants, 31 J. LEGAL PROF. 297, 305 (2007). For example, a post on a
pre-application criminal convictions, it is important to identify all of bar applicants’ prior convictions and include them in the statistical analysis. States such as California, Florida, Michigan, and Texas, which require applicants to produce criminal record histories or fingerprints,167 or Pennsylvania, which directly asks applicants about expunged or sealed criminal matters,168 may be better positioned to study the actual relationship between pre-application criminal convictions and subsequent lawyer misconduct.169

Another area that deserves closer study is the possible connection between academic misconduct and subsequent lawyer discipline. As previously noted, some studies have shown a connection between academic cheating in college and graduate school and deviant behavior in the workplace.170 No bar applicant in the Connecticut study reported any academic misconduct, which could mean that all those who are sanctioned for academic misconduct during college were denied admission to law school and that those who engaged in academic misconduct in law school were expelled, so that they were ineligible to apply to the bar.171 It seems more likely, however, that the absence of reported academic misconduct is due to a failure to detect academic misconduct or to attempts to address this misconduct informally rather than in writing.172

169. Even if more complete information about criminal histories is obtained, it is important to control for practice setting, as applicants with criminal histories are more likely to have difficulty gaining admission to top-tier law schools and are therefore more likely to work in solo and small firm practices.

170. See supra notes 97–100 and accompanying text.

171. It is not always the case, however, that those who engage in academic misconduct during law school are expelled or precluded from admission to the bar. See, e.g., In re Graham, 100 So. 3d 299 (La. 2012); In re Zhiqin, 433 N.W.2d 871 (Minn. 1988).
than through law school disciplinary sanctions that must be reported to the bar.\textsuperscript{172} In the late 1980s—when many of the lawyers in the Connecticut study were in college—40–60\% of undergraduates admitted to engaging in academic dishonesty.\textsuperscript{173} A 2006 study revealed that 45\% of law students admitted to cheating in law school at least once in the previous academic year.\textsuperscript{174} A closer examination of the actual rate of academic misconduct among disciplined and never-disciplined lawyers may reveal that pre-application academic misconduct is associated with subsequent lawyer misconduct.

Further study is also needed to determine the relationship between pre-application psychological disorders and later discipline. As noted, the Connecticut study showed that prior diagnosis of, or treatment for, a psychological disorder was a weak predictor of less severe discipline. Five of the six disciplined Connecticut lawyers who had reported a previous psychological diagnosis/treatment on their applications only received a single reprimand\textsuperscript{175} and they received the grievance leading to discipline more than ten years after they entered practice.\textsuperscript{176} The low-level discipline among this group is not surprising. Those who seek psychological treatment may be less likely to cause serious harm than those with undiagnosed and untreated psychological disorders. Additional research is warranted, however, because the actual incidence of psychological diagnosis or treatment is probably higher among bar applicants than the Connecticut study suggests.\textsuperscript{177} The true incidence of

\begin{itemize}
\item Law schools may also be reluctant to report academic misconduct determinations to bar examining committees. I have heard one former law school dean state that he never reported students’ academic misconduct to the bar during his long tenure as dean. I have also heard of cases in which academic misconduct was handled informally between the faculty member and the student to avoid the need to report the misconduct to the bar.
\item\textsuperscript{174} See Emily Sachar, \textit{MBA Students Cheat More Than Other Grad Students, Study Finds}, \textit{Bloomberg} (Sept. 25, 2006), http://www.bloomberg.com/apps/news?pid=newsarchive&sid=aw7s9m0BmcBo. It should be noted that the response rate was only 13\%. Lucia Graves, \textit{Which Types of Students Cheat Most?}, \textit{U.S. News \& World Report} (Oct. 3, 2008), http://www.usnews.com/education/articles/2008/10/03/which-types-of-students-cheat-most.
\item\textsuperscript{175} See Levin et al., supra note 26, at 27–28. The sixth lawyer received a sanction of conditions for one matter, a reprimand for a second matter, and then was placed on disability/inactive status due to severe depression after receiving a third grievance.
\item\textsuperscript{176} See \textit{id.} at 28. None of the five who received a single reprimand claimed that psychological disorders contributed to conduct that led to discipline, although two referenced stressors in their lives (e.g., family issues, personal illness) during their discipline proceedings.
\item\textsuperscript{177} Only 29 lawyers in the Connecticut study (2.16\%) reported any prior diagnosis of, or treatment for, a psychological disorder. \textit{Id.} at 9. This rate is well below what would be expected in
\end{itemize}
psychological disorders is no doubt substantially higher.\textsuperscript{178} The focus of such research should be on the frequency and consequences of serious psychological disorders that require treatment for an individual to function effectively in the workplace.\textsuperscript{179} This research should include both review of admissions files and interviews with disciplined lawyers in an attempt to determine whether serious psychological disorders were present at the time of application that were not revealed on bar admissions forms and how, if at all, such disorders affected subsequent conduct.

Likewise, additional study of the significance of pre-application substance dependency is needed. Substance dependency is of great concern in the legal profession because of the number of lawyers involved in discipline proceedings who have substance problems.\textsuperscript{180} The Connecticut study found that pre-application substance dependency or treatment for dependency does not predict discipline, but very few bar applicants (13 total) in the study reported substance dependency or treatment.\textsuperscript{181} This reported rate (.97\%) almost certainly understates the true rate of substance dependency and treatment among applicants,\textsuperscript{182} as it is substantially less than the rate of alcohol dependency (7.2\%) and drug dependency (2.8\%) in the general population during that period.\textsuperscript{183}
Substance dependency can be very difficult for bar authorities to detect if it is not disclosed by the applicant or is not otherwise revealed in the bar application (e.g., drug possession charges, DUls). While those who are treated for substance dependency are likely to do better with remission than those who are not, even treated individuals who initially remit often relapse. Highly educated professionals are not immune from relapse— which is inherent in law practice. Thus, pre-application substance dependency and treatment deserve further research because relapse rates present some indication that past substance dependency may predict future behavior that could lead to lawyer misconduct.

Credit history also deserves further study, but for different reasons. The CBEC obtained credit histories from credit bureaus for all bar applicants, so it presumably obtained fairly complete information. As previously noted, the elevated rate of discipline (2.7 percentage points) for applicants with delinquent credit accounts may have been because these applicants were more likely to subsequently work in solo and small

**PSYCHIATRY** 8, 12 (1994). Those figures reflect the percentage of individuals who reported dependency in the past twelve months. The rate of alcohol disorders alone among lawyers was 9.42%. See Frederick S. Stinson & Samar Farhar DeBakey, Prevalence of DSM-III-R Alcohol Abuse and/or Dependence Among Selected Occupations, 16 ALCOHOL HEALTH & RES. WORLD 165, 168 (1992) (reporting on both abuse and dependency).

184. Rudolf H. Moos & Bernice S. Moos, Rates and Predictors of Relapse After Natural and Treated Remission from Alcohol Use Disorders, 101 ADDICTION 212, 217 (2006) (reporting that of individuals treated for alcohol problems who initially remitted, 40% of that group later relapsed). In some cases, the relapse rates following treatment for substance abuse are even higher. See Lance O. Bauer, Predicting Relapse to Alcohol and Drug Abuse via Quantitative Electroencephalography, 25 NEUROPSYCHOPHARMACOLOGY 332, 332 (2001); Jennifer Boyd Ritcher et al., Relationship of Treatment Orientation and Continuing Care to Remission Among Substance Abuse Patients, 53 PSYCHIATRIC SERVICES 595 (2002); Maureen A. Walton et al., Individual and Social/Environmental Predictors of Alcohol and Drug Use 2 Years Following Substance Abuse Treatment, 28 ADDICTIVE BEHAV. 627, 633 (2003).

187. This is not meant to suggest that applicants with a history of substance dependency automatically should be excluded from the bar, but rather that further research is needed to determine whether the actual (rather than the reported) rate of substance dependency predicts later misconduct. Even if that is the case, the risk of relapse varies depending upon a variety of factors. See, e.g., Domino et al., supra note 185, at 1457; Danielle E. Ramo & Sandra Brown, Classes of Substance Abuse Relapse Situations: A Comparison of Adolescents and Adults, 22 PSYCHOL. ADDICTIVE BEHAV. 372, 372 (2008); Walton et al., supra note 184, at 637–39. Each applicant should be considered on a case-by-case basis.
firms, where discipline is more likely to be imposed.\(^{188}\) The possibility
cannot be discounted, however, that poor credit history is associated with
behaviors and personal characteristics that are more likely to lead to
discipline. For example, there is a significant relationship between lower
credit scores and higher auto insurance losses.\(^{189}\) There is also evidence
of a relationship between certain psycho-behavioral characteristics, risky
driving histories, and risky financial behaviors that can affect credit
scores.\(^{190}\) While the credit history information analyzed in the
Connecticut study did not strongly predict future discipline, more
research is needed to determine whether a more refined analysis would
enable this information to be used to better predict future conduct.

A final area that deserves attention is bar authorities’ reliance on
expressions of remorse when making admissions decisions. Lack of
remorse for past misconduct is frequently cited as a reason for denial of
bar admission on character and fitness grounds.\(^{191}\) Yet remorse is “a
poorly formulated concept, lacking clarity and uniformity in both its
definition and the characteristics that signal its presence or absence.”\(^{192}\) It
is not a well-researched or well-recognized concept in the mental health
community.\(^{193}\) Reliance on expressions of remorse may be especially
problematic because it assumes that (1) expressions of remorse by bar
applicants genuinely reflect their views; (2) bar authorities can accurately
assess their genuineness;\(^{194}\) and (3) remorse predicts future behavior.\(^{195}\)
The inquiry is complicated by the fact that the willingness to express

\(^{188}\) See supra note 63 and accompanying text.

\(^{189}\) BRUCE KELLISON ET AL., A STATISTICAL ANALYSIS OF THE RELATIONSHIP BETWEEN
CREDIT HISTORY AND INSURANCE LOSSES 9 (Bureau of Bus. Research, ed., 2003). The meaning
of this data is complicated by the fact that those with lower credit scores may need money for their
losses and may be more likely to submit insurance claims. Patrick L. Brockett & Linda L. Golden,
Biological and Psychobehavioral Correlates of Credit Scores and Automobile Insurance Losses:

\(^{190}\) Brockett & Golden, supra note 189, at 26, 33–36.

\(^{191}\) See supra note 54 and accompanying text.

\(^{192}\) Rocksheng Zhong et al., So You’re Sorry? The Role of Remorse in Criminal Law, 42 J.

\(^{193}\) See Stephen J. Morse, Commentary: Reflections on Remorse, 42 J. AM. ACADEMY

\(^{194}\) See Mitchell Simon et al., Apologies and Fitness to Practice Law: A Practical
see also Zhong et al., supra note 192, at 43, 47 (describing judges who expressed difficulty assessing
whether expressions of remorse were genuine). Even forensic mental health professionals have
little or no expertise in evaluating remorse. Morse, supra note 193, at 54, 55.

\(^{195}\) Indeed, there is little evidence of a relationship between expressions of remorse and
recidivism among convicted offenders. See, e.g., Morse, supra note 193, at 52; Michael J. Proeve et
al., Mitigation Without Definition: Remorse in the Criminal Justice System, 32 AUSTL. & N.Z. J.
remorse and the forms it takes differ by culture. Moreover, the same misconduct may elicit two different emotions: guilt and shame. These emotions may have a different impact on the willingness to apologize and on subsequent recidivism. Personality differences may also affect expressions of remorse. Egotistical individuals who are high in narcissism and low in humility may have more difficulty apologizing and expressing remorse because doing so threatens their self-image. Those who are shame-prone or have other markers of low well-being (e.g., low self-esteem, depression) are more likely to condemn themselves. The research does not reveal, however, which individuals are more likely to engage in future misconduct.

2. Other measures of future behavior

A more accurate assessment of the likelihood that a bar applicant will prove to be a problematic lawyer may come from psychological testing, but not for some time. Psychologists are making progress toward identifying the behaviors and personality characteristics that predict certain deviant behaviors in the workplace. Their research, while promising, is not yet sufficiently developed to use for bar admissions purposes. The studies mostly involve undergraduate students and do not reveal whether the behaviors that predict misconduct when the subjects are students predict behavior years later in the workplace.

Another approach that may eventually deserve consideration is written integrity tests. Many companies use integrity tests to determine who will be a trustworthy employee in the workplace.

201. See, e.g., supra note 98–99 and accompanying text.

202. See Fine, et al., supra note 84, at 88; Paul M. Mastrangelo & Jeffrey A. Jolton, Predicting On-the-Job Substance Abuse with a Written Integrity Test, EMP. RESPONSIBILITIES & RIGHTS J., June
integrity tests ask about attitudes toward theft and prior illegal behavior. Personality-based integrity tests attempt to determine an individual’s propensity for dishonesty based on personality attributes and focus on whether an individual is likely to engage in a wider range of counterproductive work behaviors. Both overt and personality-based integrity tests substantially correlate with the Big Five personality factors of “Conscientiousness,” “Agreeableness,” and “Emotional Stability.”

Integrity tests are not presently appropriate for use in bar admissions decisions. The tests are controversial, both on legal grounds and because of questions about their validity. Integrity tests are only crude measures of who will be problematic in the workplace. For example, the Drug Avoidance and Honesty scales used in integrity tests only detect thirty percent of on-the-job abusers. At the same time, they yield many false positives. It is also possible for individuals to “fake” their results. This is not to say that integrity testing or other testing could not play a role in assessing bar applicants in the future. But in light of evidence that factors other than personality also affect ethical decision making, such tests should not be used to exclude applicants altogether. At most, they might be used as one tool in the assessment of applicants, but they are insufficiently developed to use at this time.

3. Other measures to protect the public

Even if certain pre-admission conduct predicts later lawyer...
discipline, fairness would dictate that before any individual applicant is denied admission to the bar, the risk of future misconduct should be substantial. But how substantial? At the moment, the increased risk presented by any of the character and fitness variables appears so minimal that it seems unlikely that bar admission would be denied on that basis. Moreover, even if, based on prior history, an applicant has a fifty percent chance of later being disciplined, that particular individual will not necessarily engage in subsequent misconduct. Is it fair to exclude that individual from the bar? And if not, how should bar authorities respond to the increased risk that the individual presents?

One modest response would be to require applicants who appear to pose a significant risk of becoming problematic lawyers to post a bond or to carry malpractice insurance. This would provide clients with some redress if the attorney engages in misconduct.211 A bond or malpractice insurance would provide some compensation for clients whose lawyers neglect their matters or fail to perform competently.212 Neither would provide a complete solution, however, as these requirements would not prevent misconduct. Nor would they ever adequately compensate clients who end up in removal proceedings or incarcerated because of their lawyers’ misconduct.

Conditional admission of these applicants does not readily solve this problem. Conditional bar admission permits applicants to be admitted to the bar subject to certain conditions and monitoring.213 It is usually only available to applicants who have demonstrated rehabilitation from substance dependency or successful treatment for psychological disorders.214 Conditional admission has been criticized, in part, for being used with applicants who would otherwise have been admitted unconditionally.215 There is also little evidence that it works to protect the

211. This requirement is arguably unfair to those lawyers who will never engage in misconduct, but the fact that all U.S. lawyers are not required to carry malpractice insurance is arguably even more unfair to the public. See Susan Saab Fortney, Law as a Profession: Examining the Role of Accountability, 40 FORDHAM URB. L.J. 177, 188-90, 197-200 (2012); Leslie C. Levin, Bad Apples, Bad Lawyers or Bad Decisionmaking: Lessons from Psychology and from Lawyers in the Dock, 22 GEO. J. LEGAL ETHICS 1549, 1588-89 (2009).

212. Bonding may be preferable as malpractice insurance would not protect clients from lawyers who steal from them or engage in other intentional misconduct. SUSAN SAAB FORTNEY & VINCENT R. JOHNSTON, LEGAL MALPRACTICE LAW: PROBLEMS AND PREVENTION 411 (2008).

The conditional admission period is typically for less than five years, and discipline is often first imposed more than ten years after bar admission occurs. This is not an argument for making conditional admission indefinite. Conditional admission may unfairly burden applicants who would never become problematic lawyers. These burdens include bearing the cost of the conditions—such as psychiatric evaluations and financial audits—which can be considerable. Moreover, in some states, the fact that lawyers are conditionally admitted is known to the public, which can adversely affect lawyers’ reputations and employment opportunities.

A variation on conditional admission would be to identify those applicants with significant risk factors (“SRF”) based on their past histories, but admit them with the caveat that if they engage in minor misconduct, there will be a heavy presumption that they will be sanctioned as though they have been previously disciplined. In the case of intentional misconduct, there would be a heavy presumption that they would be suspended from practice and required to reapply. Thus, for example, an SRF applicant with a history of previous convictions and other misconduct who has, for example, a forty percent chance of engaging in future misconduct, would know that he would likely face suspension if he intentionally violates the rules of professional conduct. The risk of enhanced sanctions would not deter all such lawyers from conditional admission program was implemented applicants “who would have been admitted have had conditions attached”).

Although one confidential Florida study revealed a high rate of discipline among conditionally admitted lawyers, it is not clear how much of the discipline was for failure to comply with monitoring requirements and whether the discipline related to acts that did, or were likely to, harm clients or the public. See supra notes 154–55 and accompanying text. In contrast, Connecticut has had no notable problems with conditionally admitted lawyers. Denzel, supra note 214, at 899 n.59.

218. See, e.g., Levin et al, supra note 26, at 11.

219. See Denzel, supra note 214, at 913, 917.

220. See, e.g., N.D. Admission to Practice R 8 (F) (2013). As a condition of admission, applicants may also be required to agree that regulators may contact their employers to discuss the conditionally admitted lawyer’s performance. See Letter from Jocelyn Samuels, Acting Assistant Attorney General, U.S. Dept. of Justice, to the Hon. Bernette J. Johnson, Chief Justice of the Louisiana Supreme Court 15 (Feb. 5, 2014), available at http://www.ada.gov/louisiana-bar-lof.pdf.

221. In many cases, the initial discipline response to a grievance is diversion (which is not a sanction), a private admonition, or a public reprimand. Levin, supra note 60, at 9. But an SRF lawyer would receive a more serious sanction for the first offense than would ordinarily be imposed.
misconduct, as some lawyers engage in serious misconduct (e.g., stealing client money) knowing that they will face suspension or disbarment if they are caught. This approach has the advantage, however, of not prejudging applicants based on limited evidence that they will engage in misconduct. It would also enable courts and disciplinary authorities to incorporate the lawyer’s past history into considerations about how best to protect the public when they impose discipline on SRF lawyers who actually engage in misconduct.

Another approach might be to require all lawyers to be periodically relicensed. This approach is used in Australia, where admitted lawyers must apply for a practicing certificate annually in order to continue to practice law. This permits regulators to more closely monitor the behavior of solicitors and to require them to show their fitness to practice before renewing their practice licenses. If there is evidence of substance abuse, for example, the regulatory body can then impose conditions for continuation of the license in order to protect the public.

Although annual relicensing would be difficult in the United States—which has many more lawyers than Australia—periodic relicensing (e.g., every five years) would allow regulators to track the actual behavior of lawyers in practice, rather than make judgments at the outset of an applicant’s career about whether that individual is likely to be a problem lawyer.

CONCLUSION

The character and fitness inquiry as currently constituted needs to be carefully reevaluated. In light of the limited predictive value of the information obtained during the character inquiry, it should be streamlined so that it is not so burdensome to applicants and costly to administer. Questions about past history that have no demonstrated relationship to future misconduct—or only weak predictive power—should be eliminated. Thus, for example, questions about bankruptcy and debt should be eliminated absent further evidence that they robustly predict future misconduct.

Further research is also needed. For example, it may be that criminal convictions, academic misconduct, or recent substance dependency...
predict later misconduct, but are not being reported to bar authorities. This would mean that better data collection methods might be needed rather than the elimination of certain questions from the character inquiry. Research is also needed to determine how well the character and fitness inquiry succeeds in protecting the public. For instance, what happens to individuals who are denied admission to the bar? Are they ultimately admitted elsewhere? And if so, how do they conduct themselves in practice? Data from conditional admission programs should also be analyzed to determine whether those programs actually protect the public.

This research can only occur if bar regulators assist in this process. Regulators need to retain important records, compile relevant data, and make admissions and discipline information available to researchers subject to appropriate confidentiality agreements. It has been very difficult to obtain cooperation from regulators or courts for this purpose. I have heard from regulators who bemoan the lack of cooperation by other regulators within their own states and from well-respected academics who have attempted to obtain access to this information and been denied. Bar admission authorities cannot credibly claim that the character inquiry is needed to protect the public but then deny access to the information necessary to prove or disprove this claim. If they persist in this position, the burden of proof concerning an applicant’s character and fitness to practice law should shift to bar authorities. Based on our current knowledge, bar authorities will be unable to meet that burden.

226. Anecdotally, we know that some individuals are never admitted to the bar. See, e.g., E. J. Montini, Humm’s Journey: Convicted Killer to Model Citizen, ARIZ. REPUBLIC, Feb. 7, 2010, at B1; supra note 152. We do not know, however, whether that is true for most individuals who are denied admission on character and fitness grounds.

227. Bar regulators do not always maintain admissions files or records of diversion. See Baer & Corneille, supra note 24, at 6; Levin, supra note 140, at 2–6. Many also do not track important information. When writing this article, I contacted some jurisdictions to ask about the incidence of discipline imposed on lawyers who were conditionally admitted. Of the three large jurisdictions that responded, two jurisdictions did not compile the information even for internal use.

228. For example, during the Connecticut study, I contacted other jurisdictions asking whether any of the Connecticut lawyers in the sample who were also admitted in that jurisdiction had received private discipline. Even though I was not asking about a particular individual (but rather about a group of lawyers on a list), in many cases regulators declined to answer to that question.
