Comparative Deterrence from Private Enforcement and Criminal Enforcement of the U.S. Antitrust Laws

Robert H. Lande & Joshua P. Davis¹
March 5, 2010

The purpose of this article is to determine which type of antitrust enforcement deters more anticompetitive behavior: the U.S. Department of Justice (“DOJ”) Antitrust Division’s criminal anti-cartel enforcement program or private enforcement of U.S. antitrust laws. The answer to this question—and answers to related questions concerning deterrence and compensation issues—could have important implications for the United States, pertaining both to appropriate antitrust remedies and to the course of litigation of private antitrust cases. Those answers also could influence other nations considering either adopting or changing criminal penalties for competition law violations, or allowing private rights of action by the victims of competition law violations.

Anti-cartel enforcement by the DOJ long has been the gold standard of antitrust enforcement worldwide. If a country were to have only one type of antitrust violation, surely it would be against horizontal cartels, and surely this law would be enforced by that country’s government officials. Even critics who believe that monopolization and vertical restraints never or rarely should be challenged almost always believe in strong anti-cartel enforcement.² People in the antitrust world disagree about many things, but it is extremely difficult to find responsible critics who do not applaud the U.S. government’s anti-cartel program.³ We strongly agree with this almost-unanimous consensus and are second to no

¹ The authors are, respectively, Venable Professor of Law, University of Baltimore School of Law, and a Director of the American Antitrust Institute; Professor of Law and Director, Center for Law and Ethics, University of San Francisco School of Law, and member of the Advisory Board of the American Antitrust Institute. This article in part relies upon and significantly extends analysis contained in the authors’ earlier joint work, *Benefits From Private Antitrust Enforcement: An Analysis of Forty Cases*, 42 U.S.F. L. REV. 879 (2008) [hereinafter *Benefits*], available at http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1090661. For summaries of the individual case studies analyzed in this article see Robert H. Lande & Joshua P. Davis, *Benefits from Antitrust Private Antitrust Enforcement: Forty Individual Case Studies*, http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1105523 (last revised Oct. 15, 2008). The authors are grateful to the American Antitrust Institute for funding the empirical portions of this study, to participants in conferences sponsored by American Antitrust Institute, George Washington University, and the Lear Conference for comments and suggestion, and to Thomas Appel, Christine Carey, Joanna Diamond, Ken Fung, and Thomas Weaver for valuable research assistance.

² See ROBERT BORK, *THE ANTITRUST PARADOX: A POLICY AT WAR WITH ITSELF* 66-67 (2d ed. 1993).

one in our appreciation of the DOJ's anti-cartel activity. In terms of taxpayer dollars well spent, the program surely is one of the most outstanding in all of government.

By contrast, private antitrust enforcement under United States antitrust laws gets little respect and much criticism. Indeed, it is difficult to find many people other than members of the plaintiffs' bar willing to say much good about private enforcement. For example, even moderates like FTC Commissioner J. Thomas Rosch believe that treble damage class action cases "are almost as scandalous as the price-fixing cartels that are generally at issue. . . . [T]he plaintiff's lawyers. . . stand to win almost regardless of the merits of the case."⁴ Due to these widespread beliefs former FTC Chairman William E. Kovacic recently summarized the conventional wisdom about private enforcement succinctly: "private rights of actions U.S. style are poison."⁵

Given these criticisms, it may come as a surprise—even a shock—that a quantitative analysis of the facts demonstrates that private antitrust enforcement probably deters more anticompetitive conduct than the U.S. Department of Justice's anti-cartel program.⁶ This

³ Both Democratic and Republican Administrations have made anti-cartel activity their highest priority. Both have succeeded wonderfully at this crucial task and for this they have been applauded widely. It is difficult to find many who have even questioned the DOJ's anticartel enforcement, except for small criticisms at the margins. If we may use the terms of professors, it is possible to find critics who give the DOJ anti-cartel programs an "A" instead of an "A+," but almost impossible to find responsible critics grading them lower than this. See AMERICAN ANTITRUST INSTITUTE, THE NEXT ANTITRUST AGENDA: THE AMERICAN ANTITRUST INSTITUTE'S TRANSITION REPORT ON COMPETITION POLICY TO THE 44TH PRESIDENT OF THE UNITED STATES, 2-3 (2008) [hereinafter AAI TRANSITION TEAM REPORT], available at <http://www.antitrustinstitute.org/Archives/transitionreport.ashx>. By contrast, it is easy to find critics on both sides of the political aisle giving much lower grades, even failing grades, to other DOJ antitrust programs. For example, the AAI Transition Team Report sharply criticized the DOJ's record in the Section 2 area. See *id.* at 55, 58-59.

⁴ J. Thomas Rosch, Fed. Trade Comm'n Comm'r, Remarks to the Antitrust Modernization Commission (June 8, 2006), available at <http://www.ftc.gov/speeches/rosch/Rosch-AMC%20Remarks.June8.final.pdf>, at 9-10. Similarly Steve Newborn, co-head of Weil, Gotshal and Manges' Antitrust/Competition practice, was asked which areas of antitrust need reform, and replied: "[c]lass actions: they are increasingly beneficial only to plaintiffs' law firms and not to consumers." Law360, Q&A With Weil Gotshal's Steven A. Newborn, June 2, 2009, <http://competition.law360.com/articles/103359> (last visited Feb. 12, 2010).

⁵ FTC:WATCH No. 708, Nov. 19, 2007, at 4 (quoting William E. Kovacic speaking at an ABA panel on Exemptions and Immunities where he summarized the conventional wisdom in the field but was not necessarily agreeing with it). For additional criticisms of private antitrust enforcement see *Benefits*, *supra* note 1, at 883-89.

⁶ We will not, however, attempt to compare private enforcement to FTC enforcement, because, except for a few disgorgement cases, the FTC obtains only injunctive relief.

deterrence effect is, of course, in addition to its virtually unique compensation function.⁷ If this article's conclusion about the importance of private enforcement for deterrence is true, private antitrust enforcement also should receive much of the praise given to DOJ anti-cartel efforts. Further, private enforcement should be encouraged in the United States rather than hampered through new legislation⁸ or through restrictive judicial interpretation of existing law.⁹ And the United States' version of private antitrust enforcement also becomes something for other countries to consider.

Section I of this paper analyzes the deterrence effects of DOJ anti-cartel efforts by studying DOJ cases filed from 1990 to 2007. Section II compares these results to the cumulative deterrence effects of a sample of 40 large private cases that ended during this same period. (We do not compare the DOJ with the deterrence effects of every private case filed during this period, however, because we were unable to obtain this information).

Before coming to any policy conclusions based on this comparison, we address some criticisms of private enforcement. Few commentators dispute that most DOJ anti-cartel prosecutions involved anticompetitive conduct or that most DOJ cartel cases should have been brought. But are most private enforcement cases legitimate? Do most involve anticompetitive behavior? Considering the widespread criticism within the profession of private enforcement, and that most successful private cases result only in settlements, do these cases mostly involve underlying anticompetitive conduct? We address this topic in Section III, concluding that the evidence suggests the legal actions on which we rely did indeed entail claims with merit. Section IV then acknowledges some qualifications and caveats.

Finally, Section V concludes by offering policy suggestions that follow from our analysis. Our results demonstrate that private enforcement most certainly has crucial deterrence effects. These effects are so important that U.S. courts should not continue their steps to curtail private enforcement, and foreign jurisdictions should consider permitting private enforcement of competition laws as a complement to government efforts.

⁷ See *Benefits*, *supra* note 1, at 881-83; Harry First, *Lost in Conversation: The Compensatory Function of Antitrust Law* (unpublished draft 2009) (on file with author). Another goal of private enforcement is to restore competition to markets. See *Benefits*, *supra* note 1, at 881.

⁸ An example is the Class Action Fairness Act ("CAFA"). Pub. L. No. 109-2, 119 Stat. 4 (codified throughout 28 U.S.C.). CAFA allows defendants to remove most class actions to federal court and, as a result, arguably makes class certification for state law claims more difficult. See, e.g., Stephen Burbank, *The Class Action Fairness Act of 2005 in Historical Context: A Preliminary View*, 156 U. PA. L. REV. 1439, 1530-31 (noting one goal of CAFA was to make class certification more difficult for plaintiffs).

⁹ See, e.g., *Bell Atl. Corp. v. Twombly*, 550 U.S. 544 (2007) (overruling *Conley v. Gibson*, 355 U.S. 41 (1957), and applying heightened pleading standard to private antitrust case).

I. Deterrence From DOJ Anti-Cartel Cases

The DOJ Antitrust Division can deter illegal cartel activity in several ways. First, it can request that courts fine the corporations involved. Second, it can request that the most culpable individuals be fined. Third, it sometimes asks for restitution. Fourth, it can request that some of the individuals involved be imprisoned or placed under house arrest.¹⁰ The Division also can secure injunctions to restore competition to the affected markets. Since we know of no way to value these injunctions, however, or to compare them to injunctions secured by private parties, we have omitted them from our analysis.¹¹

A. Optimal Deterrence of Cartels

The most generally accepted approach to optimally deterring antitrust violations was developed by Professor William Landes,¹² who convincingly showed that to achieve optimal¹³ deterrence,¹⁴ the total amount of the sanctions imposed against an antitrust violator

¹⁰ U.S. DEP'T OF JUSTICE, ANTITRUST DIVISION WORKLOAD STATISTICS 1999-2008 n.14, <http://www.usdoj.gov/atr/public/workstats.pdf> (last visited May 26, 2009) (The term other confinement “[i]ncludes house arrest or confinement to a halfway house or community treatment center.”).

¹¹ Additionally, DOJ cases often set important legal precedents which can deter anticompetitive conduct significantly. We do not know how to value these precedents, however, or to compare their value to the value of precedents established through private enforcement. For an excellent analysis of this topic see Stephen Calkins, *Coming to Praise Criminal Antitrust Enforcement*, European University Institute 11th EU Competition Law and Policy Workshop, (Florence, Italy, June 2-3 2006). Calkins found that, of leading antitrust cases decided before 1977, 12 were private and 27 were government. Of the leading cases decided in 1977 or later, however, he found 30 private cases and only 15 government cases. *Id.* at 17 (sample taken from the leading cases printed in the leading antitrust casebook). Calkins concluded: “[t]oday what is known as U.S. antitrust law no longer is exclusively or even principally the consequence of Justice Department [or FTC or State] enforcement. The leading modern cases on monopolization, attempted monopolization, joint ventures, proof of agreement; boycott; other horizontal restraints of trade, resale price maintenance, territorial restraints, vertical boycott claims, tying, price discrimination, jurisdiction, and exemptions are almost all the result of litigation brought by someone other than the Justice Department [or the FTC of the States].” *Id.* at 18-19 (citations omitted).

¹² William M. Landes, *Optimal Sanctions for Antitrust Violations*, 50 U. CHI. L. REV. 652, 656 (1983). Landes built upon concepts developed in Gary S. Becker, *Crime and Punishment: An Economic Approach*, 76 J. Pol. Econ. 169 (1968), applying them to the antitrust field.

should be equal to the violation's expected "net harm to others," divided by the probability of detection and proof of the violation.¹⁵ Moreover, because not every cartel is detected or successfully sanctioned, the "net harm to others" from cartels should be multiplied by a number that is larger than one (the multiplier should be the inverse of the probability of detection and proof).¹⁶ In other words, the optimal penalty = (harms) ÷ (probability of detection x probability of proof).

In applying Landes' model we will undertake several important steps that warrant noting. First, we will attempt to compare financial penalties imposed on corporations with

¹³ The goal is optimal deterrence not complete deterrence because enforcement aggressive enough to deter all cartels is likely to unduly penalize honest business conduct. Therefore a proper balance must be struck to achieve optimal deterrence.

¹⁴ Professor Landes was not concerned with compensating victims. For an analysis that takes victim compensation into account, see Robert H. Lande, *Are Antitrust "Treble" Damages Really Single Damages?*, 54 OHIO ST. L.J. 115, 161-68 (1993), available at http://papers.ssrn.com/sol3/papers.cfm?abstract_id=1134822.

¹⁵ See Landes, *supra* note 12, at 666-68. If the harm were ten and the probability of detection and proof were .333..., since (10/.333... = 30) the optimal penalty for this violation would be 30. This ignores risk aversion and other factors. See *id.* Analysts of both the Chicago and post-Chicago schools of antitrust have almost universally accepted these principles. See Landes, *supra* note 14. Despite the general acknowledgement of the superiority of the Landes approach, however, many respected scholars and enforcers instead focus upon the gain to the lawbreaker, perhaps because it simpler to calculate. For an insightful analysis see Wouter P. J. Wils, *Optimal Antitrust Fines: Theory and Practice*, 29 World Competition 183, 190-93 (2006).

¹⁶ "Of course, no one knows the percentage of cartels that are detected and proven. In 1986, the Assistant Attorney General for Antitrust, Douglas Ginsburg (AAG Ginsburg), estimated that the enforcers detected no more than 10% of all cartels. There are reasons to believe that the Antitrust Division's amnesty program has resulted in a larger percentage of cartels detected and proven today, but there is anecdotal evidence that, despite the enforcers' superb efforts, many cartels still operate. From an optimal deterrence perspective it would be necessary to know the percentage of cartels that are detected and proven to know what number to multiply the 'net harms to others' by. At a minimum, however, we know that if the combined antitrust sanctions only total the actual damages, firms would be significantly undeterred from committing antitrust violations. Ideally, optimal deterrence should be based upon the expectations of potential price fixers, not the results of their pricefixing or the actual fines imposed. To ascertain this, however, we would have to interview a random sample of potential price fixers and discern their expectations. In reality, however, it would be impossible to assemble a proper random sample or to get them to respond candidly." John M. Connor & Robert H. Lande, *How High Do Cartels Raise Prices? Implications for Optimal Cartel Fines*, 80 TUL. L. REV. 513, 519-20 (2005) (citations omitted).

similar penalties imposed on the individual corporate actors who are personally responsible for an antitrust violation. Second, we will attempt to compare financial penalties with time in prison (or time spent under house arrest).

Of course, making these comparisons in an objective, accurate and non-controversial manner is not possible. The conventional wisdom seems to be that fines are superior to prison as a way to secure optimal deterrence.¹⁷ However, one might argue, to put the points in their strongest form, that corporate actors care only about their own financial well-being and that prison sentences are so abhorrent¹⁸ that no corporate actor would be willing to risk prison, no matter how large the financial gain (or, to put the point somewhat differently, that a corporate actor would be willing to pay virtually any amount of money to avoid the risk of prison).¹⁹

¹⁷ The conventional wisdom in the field was well summarized by V.S. Khanna, *Corporate Criminal Liability: What Purpose Does it Serve*, 109 Harv. L. Rev. 1477 (1996) (“Thus, some justification for corporate criminal liability might have existed in the past, when civil enforcement techniques were not well developed, but from a deterrence perspective, very little now supports the continued imposition of criminal rather than civil liability on corporations.”).

¹⁸ See Gregory J. Werden, *Sanctioning Cartel Activity: Let The Punishment Fit The Crime*, 5 European Competition J. 19, 31 (2009); A. Linman, *The paper Lable Sentences: A Critique*, 86 Yale L. J. 630, 630-31 (1977) (“To the businessman ... prison is the inferno, and conventional risk-requard analysis breaks down when the risk is jail.”); D. Baker and B. Reeves, *The Paper Lable Sentences: Critiques*, 86 Yale L. J. 619, 621-22 (1977) (“Experience supports the conclusion that businessmen view prison as uniquely unpleasant and therefore incarceration is a uniquely effective deterrent.”).

¹⁹ *Id.* Note the important difference in these two baselines: a corporate actor might demand a different sum to risk prison than they would be willing to pay to avoid the risk of prison. For example, suppose someone would rather pay a \$2 million fine than be imprisoned for a year. How would that person react to the question of whether they would accept \$2 million in return to going to prison for a year? They might not agree to this deal. Part of the difference is the relative wealth of the actor in the two situations. A corporate actor can demand an unlimited amount to accept the risk of prison. And any such payment increases his or her wealth. But the same person cannot pay an unlimited amount to avoid the risk of prison. She can only spend as much money as she has or can borrow. See David Cohen and Jack L. Knetsch, *Judicial Choice and Disparities Between Measures of Economic Values*, in CHOICES, VALUES AND FRAMES 428 (2000). But there is another element at play here as well. Empirical evidence shows that people’s attitude toward costs and benefits depend on their perception of the *status quo*. *Id.* at 428-29. A person who accepts prison as the *status quo* may be willing to pay less to avoid it than a person who sees prison as a deviation from the *status quo*. A corollary is that, depending on the odds and stakes, people value avoiding losses—and are willing to take risks to do so—far more than they value gains—which they generally will not take risks to do (although, oddly, this principle may vary depending on the odds of the risk and the size of the gain or loss). See Daniel Kahneman and Amos Tversky,

The extreme form of these arguments is unpersuasive. Corporate actors do in fact risk their own prison time for the financial benefit of their employers when they violate the antitrust laws—by, for example, participating in price fixing. Moreover, the literature on antitrust law generally assumes that corporations maximize profits, which means that it also assumes the interests of corporate representatives and corporations generally align.²⁰ Any other approach would greatly complicate antitrust analysis, requiring an inquiry not only into the market and its participants, but also into the internal workings of particular corporations. Indeed, there is an odd—and usually unexplained—inconsistency when proponents of the free market claim that corporations should not be subject to civil liability for the wrongdoing of their representatives: If the free market works in the sense that corporations respond in an efficient manner to market incentives, including by encouraging corporate representatives to act for the benefit of the corporation, why shouldn't the same be true of legal sanctions?²¹

Choices, Values, and Frames in CHOICES, VALUES AND FRAMES 35-36 (2000)). This psychological phenomenon—and others—greatly complicates an economic analysis of behavior. So, for example, a corporate actor who perceives herself as taking steps that violate the antitrust law to return to the *status quo* (perhaps because she thinks her corporation is suffering from unfair competition) may be far more tolerant of risk than the same corporate actor who contemplates the same measure as a means of obtaining a perceived economic advantage. Even for a single corporate actor, then, there may be no single correct amount that represents her willingness to trade off between gain for her corporation and the risk of prison for herself.

²⁰ See, e.g., RICHARD A. POSNER, ANTITRUST LAW ix (2d ed. 2001) [hereinafter, ANTITRUST LAW] (arguing that his brand of economic analysis of antitrust law has come to predominate judicial doctrinal, with a consensus that “business firms should be assumed to be rational profit maximizers, so that the issue in evaluating the antitrust significance of a particular business practice should be whether it is a means by which a rational profits maximizer can increase its profits at the expense of efficiency”). See also Richard A. Posner, *Optimal Sentences for White-Collar Crime*, 17 AM. CRIM. L. REV. 409, 418 & n. 27 (1979-1980) (acknowledging that he has made “an argument. . . in the antitrust context for confining criminal (or civil-penalty) liability to the corporation, on the theory that if it is liable it will find adequate ways of imposing on its employees the costs to it of violating the law.”) (citing RICHARD A. POSNER, ANTITRUST LAW: AN ECONOMIC PERSPECTIVE 225-26 (1976)) [hereinafter “*Optimal Sentencing*”]. The same is true for scholars of a similar ilk in the field of securities. See, e.g., EASTERBROOK AND FISCHER, THE ECONOMIC STRUCTURE OF CORPORATE LAW 4 (2008) (“managers may do their best to take advantage of their investors, but they find that the dynamics of the market drive them to act as if they had investors’ interests at heart. It is almost as if there was an invisible hand.”).

²¹ See, e.g., Christopher D. Stone, *Sentencing the Corporation*, 71 B.U. L. REV. 383, 385 (1991) (“While it is true that managers have a hard time getting the rank and file to adapt to market threats, no one suggests that corporations are so hidebound or so buffered from their capital environments that market penalties must be ruinously high before the company will respond. Why should it be otherwise with legal penalties?”).

The work of Richard Posner provides a useful illustration. He addresses—and rejects—the twin concerns about correlating financial penalties to corporations with prison terms for corporate representatives: (1) that corporate representatives have different interests than corporations and (2) that prison time cannot be equated with a monetary sum. The first issue involves a potential divergence of interests between principal and agent, which economists tend to call agency costs. Posner’s response: “A corporation has effective methods of preventing its employees from committing acts that impose huge [antitrust] liabilities on it. A sales manager whose unauthorized participation in a paltry price-fixing scheme resulted in the imposition of a \$1 million fine on his employer would thereafter, I predict, have great difficulty finding responsible employment, and this prospect should be sufficient to deter.”²² In other words, corporations can and will impose incentives that align their interests and the interests of their representatives.

Posner has also addressed the second issue—the concern that prison time cannot be correlated to financial penalties. He has argued for “the substitution, whenever possible, of the fine (or civil penalty) for the prison sentence as the punishment for crime. . . .”²³ His contentions are, particularly in cases of “white collar” crime,²⁴ that a sufficiently large financial penalty is just as effective as the threat of prison, and “that it is cheaper to administer and therefore socially preferable.”²⁵ As he notes, “The fine [or civil liability] for a white collar crime can be set at whatever level imposes the same disutility on the defendant, and thus yield the same deterrence, as the prison sentence that would have been imposed instead.”²⁶

²² *Id.* at 271. *But see* John Coffee, Jr., *Corporate Crime and Punishment: A Non-Chicago View of the Economics of Criminal Sanctions*, 17 AM. CRIM. L. REV. 419, 458-59 (1980) [hereinafter “*Corporate Crime and Punishment*”] (noting examples of limited internal sanctions imposed against individuals responsible for antitrust violations).

²³ Posner, *Optimal Sentences*, *supra* note 20, at 409.

²⁴ *Id.*

²⁵ *Id.*

²⁶ *Id.* at 410. Posner is familiar with resistance to this claim—indeed, his article responds in part to a sophisticated criticism by John Coffee that contends that “the threat of imprisonment is inherently greater than that of a fine,” *id.* at 413 (citing Coffee, *Corporate Crime and Punishment*, *supra* note 22), or, presumably, civil liability. Posner usefully distills Coffee’s argument to three points: (1) financial penalties work only if the culpable party has the means to pay them; (2) fines themselves work only if backed by a sufficient penalty for non-payment (otherwise they will not be paid); and (3) culpable parties are likely to experience an increasing marginal loss of utility as fines get larger (at least up until the point that they have no money left), but a decreasing marginal loss of utility as prison sentences grow in length. *Id.* at 413-14. The first two points have only limited significance for our paper: corporations generally can pay the damages they owe and courts have methods of making them do so,

Thus skeptics of private enforcement with a Chicago school orientation—including Posner himself²⁷—should not rely on agency costs or the inherent superiority of prison as a deterrent to reject an effort to compare the deterrence effects of private enforcement and criminal prosecutions.²⁸

More plausible points are that a financial penalty against an individual has more of an impact than a similar penalty against a corporation and that a year of prison time is equivalent to a relatively large financial penalty. We make accommodations for these

including mulcting them with sanctions for contempt. But Coffee’s point about the potentially complicated relationship between financial penalties and prison time does suggest that any ratio between prison time and money will be an imperfect approximation.

²⁷ See, e.g., Posner, ANTITRUST LAW, *supra* note 20, at . 274-75. Posner’s concern about antitrust class actions is particularly curious. He levels two criticisms: first, that class action lawyers have incentive to settle cases for relatively small amounts compared to their actual worth and, second, that risk averse corporations may settle claims for too much because of an unlikely possibility of an extraordinarily large loss. *Id.* at 275. Posner does not address that these tendencies—if real—are off-setting.

²⁸ Indeed, Posner even suggests what he believes to be a feasible method for estimating the trade-off between years in prison and monetary sanctions:

[A] promising method would be to infer statistically the relative deterrent effect of fine and prison. Suppose that in one federal district the average fine for a federal white-collar offense is \$1,000 and the average prison terms 30 days, and in another district it is \$800 and 40 days, and so forth. Then, by comparing the incidence of the offenses across districts, we should be able to infer the rate of exchange at which days in jail translate into dollars of fine with no loss of deterrence. (A study of state white-collar prosecutions, conducted along similar lines, might also be feasible.) Since no such study has been attempted, I cannot evaluate the difficulties it might encounter arising, for example, because the incidence of many white-collar crimes (e.g., price-fixing conspiracies) is unknown, or the gravity of crime may vary across districts, which affects the optimal sentencing. Such a study might not produce results entitled to great confidence. Nevertheless, supplemented by the intuition that judges today in devising fine-prison “packages” to impose on white collar offenders, such a study should provide a close enough approximation of the actual fine-prison trade-off that we need not fear that by substituting fines for prison sentences in white-collar cases we would be drastically altering the expected punishment cost, and hence the level, of white-collar crime.

Posner, *Optimal Sentences*, *supra* note 20, at 413. We know of no study along these lines. And, of course, the analysis assumes that compliance with antitrust law depends primarily, perhaps even exclusively, on the incentives created by money or prison. *Cf.* Christopher D. Stone, *supra* note 21, at 389 (arguing that the “moral responsibility” to obey the law explains the compliance of many corporate actors).

plausible assumptions in our analysis *supra* by tripling the disvalue or deterrence effects of individual sanctions relative to corporate sanctions.²⁹

Perhaps optimal deterrence only can be secured by a mix of corporate and individual sanctions. If violations only were subject to corporate penalties, individuals might be unduly tempted to form cartels if, as has been suggested by some research,³⁰ they do not face significant internal sanctions for their illegal behavior³¹ or an appropriate diminution of their future income. On the other hand, if only individual penalties existed, it could be in the interests of some corporations to establish internal incentives that failed to discourage, rewarded, or even coerced employees into engaging in illegal behavior.³² Some corporations might prefer to offer up a few executives for multi-year prison terms rather than pay \$100 million or more in a criminal fine or payout in private litigation.³³

²⁹ A critic of private enforcement could argue that even a very large amount of money paid by the corporation is meaningless from a deterrence perspective—that managers could care less how much money their corporations pay. *See, e.g.,* John Coffee, “*No Soul to Damn, No Body to Kick*”: *An Unscandalized Inquiry Into the Problem of Corporate Punishment*, 79 MICH. L. REV. 386, 393 (1981). They could argue that only individual fines and prison matter at all from a deterrence perspective, so private enforcement does not deter anything. Of course, this view contradicts the basic assumption that corporations are profit maximizers. Surely corporations do not like paying millions or billions of dollars, so there must be some deterrence from private cases. Moreover, the individuals responsible for this liability are likely to have their careers detrimentally affected when their actions require their corporation to pay large sums in private cases. *See* POSNER, ANTITRUST LAW, *supra* note 20, at 271 (arguing that causing a corporation to suffer financial losses will harm careers of employees); *cf.* Coffee, *Corporate Crime and Punishment*, *supra* note 22, at 458-59 (providing examples of corporate representatives violating the law to the detriment of the corporation but not suffering adverse consequences). For these reasons, while correlating financial penalties to corporations with prison time to corporate representatives is tricky, it seems to overstate the case to suggest there is no correlation whatsoever.

³⁰ *See Corporate Crime and Punishment*, *supra* note 22, at 458-59.

³¹ Greg Werden suggests additional reasons: “This can occur as a result of defects in the design of compensation schemes, especially if the executives have short time horizons or are more willing than business enterprises to take risks. Consequently, business enterprises can incur substantial costs in monitoring their executives and complying with the law.” *See* Gregory J. Werden, *Sanctioning Cartel Activity: Let The Punishment Fit The Crime*, 5 European Competition J. 19, 31-32 (2009) (footnotes omitted).

³² *Id.* at 32.

³³ Suppose that, instead of a corporate fine or payouts in private cases, a corporation could offer up to the Department of Justice five executives who would each be sentenced to 3 years in prison. Suppose the corporation could pay each of the individuals involved \$2 million per executive per year by depositing the appropriate sums in Swiss bank accounts. This would

In light of these complexities, this article will use a total deterrence approach, and will determine the sum of individual and corporate deterrence. As noted earlier, our analysis will make accommodations for these complexities and agency-principle problems by tripling the disvalue or deterrence effects of individual sanctions relative to corporate sanctions. With these qualifications in place, we can begin our analysis by addressing the deterrence effect of the Department of Justice's enforcement of the antitrust laws.

B. Deterrence from DOJ Cartel Fines and Restitution

The Antitrust Division successfully has prosecuted hundreds of cartels. While it is of course impossible to determine how many cartels never were formed due to the prospect of penalties resulting from investigations (*i.e.*, how much deterrence its cases were responsible for), surely it is significant. We will address in turn various DOJ remedies—corporate fines, individual fines, restitution, and imprisonment.

The total of the corporate fines imposed in every DOJ antitrust case from 1990 to 2007 has been \$4.166 billion.³⁴ The total of the individual fines imposed in these cases has been \$67 million.³⁵

During this same period, the Antitrust Division has also secured restitution of \$118 million in conjunction with criminal antitrust cases.³⁶ This largely or totally consists of restitution to the federal government for the overcharges it paid to price fixers. As the Division's Workload Statistics notes with considerable understatement, "Frequently restitution is not sought in criminal antitrust cases, as damages are obtained through treble damages actions filed by the victims."³⁷

C. Deterrence Effects of Prison and House Arrest

DOJ prosecutions also result in prison sentences and house arrests, which significantly deter illegal activity as well. From 1990 to 2007 criminal prosecutions by the Department of Justice Antitrust Division have resulted in sentences that total 330.24 years in prison.³⁸ In addition, Antitrust Division activity also has led to another 96.85 years of "house

only cost the corporation \$30 million, far less than many of the larger fines that have been imposed in recent years, and less than the private payouts in every one of the cases studied by the authors in their sample of private cases.

³⁴ See tbl. 1.

³⁵ See tbl. 2.

³⁶ See tbl. 3.

³⁷ WORKLOAD STATISTICS 1999-2008, *supra* note 10, at n.13.

arrest or confinement to a halfway house or community treatment center.”³⁹ However, these figures might be somewhat inaccurate for the purposes at hand, for two reasons.

First, these figures are for time sentenced, not time served. We were unable to determine how much of this time actually was served or how often sentences were reduced. Second, sometimes an investigation by the Antitrust Division results in a sentence for an unrelated or marginally related crime regardless of whether an antitrust violation was uncovered. Unrelated crimes can include perjury, mail fraud, contempt, obstruction of justice, and false statements.⁴⁰ Since the Antitrust Division uncovered these crimes, often Antitrust Division investigators are in the best position to pursue these issues, even though they are not antitrust violations. They often do so but, unfortunately, we have not been able to find out how frequently this occurs.⁴¹

For simplicity we are ignoring these issues. The figures reported above for prison time and house arrest therefore will be used in our subsequent analysis even though they are larger than they should be. As such, these unadjusted estimates will overestimate the probable deterrence effect of the DOJ anti-cartel program to some extent.

Using these figures, how could we fairly value—or disvalue—time spent in prison or under house arrest? Since no one wants to spend any time in prison or under house arrest, should we disvalue it infinitely and assume that even a small probability of spending any time in prison or under house arrest has an infinite deterrence value?

No. People do not act as if they infinitely disvalue the risk of getting put into prison or placed under house arrest for an antitrust offense. If they did, they would never try to form a cartel because this would put them at risk of getting caught and sentenced. Rather, potential offenders appear to tolerate the risk of prison. Perhaps they calculate, at least to some very rough degree, their apparent chances of getting caught, and the prison sentence, house arrest, or fine they are likely to face. They then balance this chance of a penalty, again in an extremely rough way, against the rewards of cartelization. In any case, often they decide to form cartels. We know they often make this decision because cartelists surely know cartels are illegal, yet the number of cartels caught in recent years has been quite significant

³⁸ See tbl.4. We define a year as equal to 365.25 days.

³⁹ See tbl.5. See also *supra* note 10.

⁴⁰ WORKLOAD STATISTICS 1999-2008, *supra* note 10, at 8 (listing these crimes under the header “Other Criminal Cases”).

⁴¹ Sometimes these other crimes are related to an antitrust offense—such as when a cartel bribes a federal purchasing agent. Other times they are not. Often they are very difficult to classify. According to the DOJ, “Other Federal Crimes such as Perjury, Mail Fraud, Contempt, Obstruction of Justice, or False Statements” have constituted 16% of their criminal convictions since 1990 (23% in recent years, when prison sentences have been longer). *Id.*

and does not seem to be decreasing.⁴² Since 1990, 550 people have been sentenced to prison or house arrest as a result of successful Antitrust Division cases against 958 cartels.⁴³ Moreover, the large number of cartels discovered in recent years may be evidence that the current overall level of cartel sanctions is too low.

Thus, in theory we can establish a non-infinite value for the disutility of prison time. To do this in practice is, of course, extremely difficult and speculative. There is no one objective way to compare the deterrence effect of time spent in prison to the deterrence effect

⁴² The continued high number of DOJ grand juries, and the recent DOJ success rate in the courts, is evidence that many cartels still exist. As of February 2004, the DOJ had approximately 100 pending grand jury investigations. Antitrust Division, U.S. Department of Justice, Status Report: An Overview of Recent Developments in the Antitrust Division's Criminal Enforcement Program 1 (2004), available at <http://www.usdoj.gov/atr/public/guidelines/202531.pdf> (last visited Sept. 28, 2005) [hereinafter Status Report]. Between 1994 and 2008, the DOJ filed from thirty-two to sixty-three criminal cases per year, most of which resulted in convictions. Antitrust Division, U.S. Department of Justice, Workload Statistics: FY 1994-2008, at 4, 7 (2004), available at <http://www.usdoj.gov/atr/public/12848.pdf> (last visited ____). The following table, extracted from this data, shows the DOJ's success in prosecuting antitrust violations:

Total Criminal Cases	'94	'95	'96	'97	'98	'99	'00	'01	'02	'03	'04	'05	'06	'07	'08
Filed	57	60	42	38	62	57	63	44	33	41	42	32	34	40	54
Won	51	65	38	40	64	48	52	38	37	32	35	36	31	31	47
Lost	4	2	5	1	1	2	-	2	1	1	1	1	-	1	4
Pending	-	-	-	-	17	24	35	39	34	42	48	43	44	54	57
Appeal Decisions	9	7	6	4	6	-	-	5	1	2	7	4	5	1	4
Grand Juries Initiated						19	26	26	26	48	21	38	38	34	32

It seems clear that in the opinion of a large number of judges, grand juries, and juries the DOJ Antitrust Division has been bringing a large number of meritorious anti-cartel cases in recent years. Note that in some years the DOJ won more cases than it filed because the cases the DOJ won in any given year were often filed in an earlier year.

⁴³ 864 individuals were charged, as were 678 corporations. All totals for the years 1990-2007 were calculated by adding the yearly totals as reported in the U.S. DEPARTMENT OF JUSTICE, ANTITRUST DIVISION WORKLOAD STATISTICS FY 1990-1998 (on file with author) and the U.S. DEPARTMENT OF JUSTICE, ANTITRUST DIVISION WORKLOAD STATISTICS FY 1998-2007, available at <http://www.usdoj.gov/atr/public/workstats.pdf>. (on file with author).

of a criminal fine because different people would trade off jail versus fines in different ways. Any “average” figure used to equate the two necessarily is imprecise and arbitrary. We will undertake three different approaches to this issue. We hope that this paper’s use of three approaches will increase the reliability of its results.

i. Valuations of Lives and Years of Life For Other Regulatory, Public Policy Purposes.

The valuation of a year of life “loss” in prison or due to house arrest is similar to one that, regrettably, society often must undertake for any number of public policy purposes. Sometimes even a life must be valued at an amount that is less than infinity. For example, our nation cannot afford perfect safety and we do not want every automobile to be built as safely as possible because society cannot afford this. Similarly, even though a life is beyond value and society does not want people to drive negligently, courts do not award infinite damages for the loss of life in car crashes.

On average, studies that value lives in the U.S. for public policy purposes, such as when we try to decide how safe to make products, or when the Department of Transportation or the Environmental Protection Agency sets policy, typically arrive at values between \$3 million and \$10 million per life.⁴⁴ By contrast, lower figures, from \$1.4 million to \$3.8 million, are awarded on average in wrongful death cases.⁴⁵ Other studies analyze the data slightly differently by attempting to place a value on a year of life. They calculate figures in the range of an average of \$300,000 to \$500,000 per person per year of life (depending upon a number of variables).⁴⁶ It is likely that most people would view the prospect of spending a

⁴⁴ See Joseph E. Aldy & W. Kip Viscusi, *Adjusting the Value of a Statistical Life for Age and Cohort Effects*, (Jan. 2008) (Vanderbilt Law and Economics Research Paper No. 08-01) available at http://papers.ssrn.com/sol3/papers.cfm?abstract_id=898189. Recently the Department of Transportation has used \$5.8 million for the value of a life.

Memorandum from Tyler D. Duvall, Assistant Secretary for Transportation Policy & D. J. Gribbin, General Counsel to Secretarial Officers & Modal Administrators, <http://ostpxweb.ost.dot.gov/policy/reports/080205.htm> (last visited May 26, 2009). The Environmental Protection Agency currently uses \$6.9 million. *All Things Considered: Value on Life 11 Percent Lower Than 5 Years Ago* (NPR radio broadcast July 11, 2008) available at <http://www.npr.org/templates/story/story.php?storyId=92470116>.

⁴⁵ See Mark A. Cohen & Ted R. Miller, “Willingness to Award” Nonmonetary Damages and the Implied Value of Life from Jury Awards, 23 INT’L REV. L. & ECON. 165, 166, 179 (2003) (calculations made in 1995 dollars).

⁴⁶ See Aldy & Viscusi, *supra* note 27. These figures are lower for older people. *Id.* A study by Stanford researchers calculated only \$129,000 per year. Kathleen Kingsbury, *The Value of Human Life: \$129,000*, TIME, May 20, 2008, available at <http://www.time.com/time/health/article/0,8599,1808049,00.html>.

year in prison as not as bad as losing a year of life; after all, many prisoners with no chance at parole still resist the death penalty.

Thus, in theory we can establish a non-infinite value for the disutility of prison time. To do this in practice is extremely difficult and speculative. While there is no way directly to value the deterrence effect of prison time, one alternative is to conclude that people would disvalue a year in prison at very roughly the same as, or less than, they would value a year's worth of life. This means the results above, which calculated the average value of a year of life to be worth \$300,000 to \$500,000 per year, should be roughly equal to (or more than?) the average disvalue of a year in prison. Moreover, a year of house arrest should be disvalued at a significantly lower figure.

ii. Awards Made By the Sept 11th Victims Compensation Fund

Following the Sept 11 tragedy, Congress created the Sept 11th Victim Compensation Fund to award compensation to victims' families.⁴⁷ Kenneth Feinberg was appointed Special Master and charged with deciding the appropriate amounts of compensation.⁴⁸ The Fund sought to avoid a "complex adversarial process" while still honoring fairness and consistency.⁴⁹ The Fund's payments thus constitute a prominent reflection of the monetary value our society places on innocent human life, even though these payouts were made under unique circumstances.⁵⁰ Significantly, the victims include a large number of middle class

⁴⁷ See the Air Transportation Safety and Stabilization Act, Pub. L. No. 107-42, 115 Stat. 230 (codified at 49 U.S.C. § 40101) (hereinafter "the Act") (We are grateful to Thomas Weaver for his research involving the September 11th Victim Compensation Fund)

⁴⁸ See generally Kenneth Feinberg, *Final Report of the Special Master for the September 11th Victim Compensation Fund of 2001, Vol 1, 1-4* (available at http://www.usdoj.gov/final_report.pdf) (hereafter "Feinberg report").

⁴⁹ See *id.* at 6. Congress mandated a "hybrid" compensation system. Like the tort system, congress required the Special Master to consider economic and non-economic loss. However, unlike the tort system, the Special Master could not consider issues of liability or punitive damages, and the Special Master was required to reduce awards by payments from certain collateral sources. *Id.* A larger purpose of the Act was to save the airline industry from collapse and to protect the American economy from the consequences of that collapse by creating an alternative to direct litigation against the airlines. See *id.* at 3; see also generally Air Transportation Safety and Stabilization Act, Pub. L. No. 107-42, 115 Stat. 230 (codified at 49 U.S.C. § 40101).

⁵⁰ The Special Master extensively researched "theories of compensation and methodologies for the calculation of economic loss, as well as the various state laws governing wrongful death actions," and met with "numerous economists, experts and actuaries, both in the private sector and in the federal government as to the calculation of economic loss and determinations on collateral sources. Between issuing its interim and final regulations, the Fund reviewed and sought to integrate "2,687 timely comments" on issues that ranged from

and upper class people who, at least in terms of their income and status as corporate executives, are likely to be roughly comparable to incarcerated price fixers.

The Fund's average award was \$2,082,035 for damages to the direct victims of the terrorist attack, plus an average offset for collateral payments (damages to family members) of \$855,826, for a total average award of \$2,937,861. The median award was \$1,677,632. The maximum award was \$7,100,000, and the minimum award was \$250,000.⁵¹

Many of the Sept. 11 victims had been quite affluent, including 89 whose annual income had been between \$500,000 and \$1,00,000 per year (their estates were given average awards of \$4,749,654), and 8 victims whose annual income exceeded \$4,000,000 per year (their estates were given average awards of \$6,379,287).⁵² Although we do not know the average or typical pre-conviction annual incomes of imprisoned price fixers, we would not be surprised if the amounts were comparable.

iii. Awards in Wrongful Imprisonment Cases

Another approach to approximating the disutility of prison or house arrest time due to antitrust violations comes from examining the disvalue society places on prison time in a very different context: the compensation provided to people who have been wrongly imprisoned. Sometimes people are wrongly sentenced to prison in a miscarriage of justice by, for example, perjured testimony.⁵³ The victims potentially can recover for a variety of torts depending upon the jurisdiction.⁵⁴ They can receive compensatory damages, emotional

the technical and specific, to fundamental questions regarding the larger purpose and policy of the Fund. See Feinberg report, *supra* note 48, at 4-5

⁵¹ Feinberg, *Final Report* at 110, tbl 12.

⁵² See Table 6.

⁵³ See *Limone v. United States*, 497 F. Supp. 2d. 143, 152 (D. Mass. 2007) (FBI was aware chief witness would perjure himself). See also *Newsome v. McCabe* 319 F.3d 301, 304-305 (7th Cir. 2003) (officers induced eyewitnesses to falsely identify plaintiff); *Mark Diaz Bravo v. Giblin*, 2002 WL 31547001, 2002 Cal. App. Unpub. LEXIS 10494 (Cal. App. 2 Dist. 2002) (investigating officer fabricated evidence).

The authors are grateful to Thomas Weaver for locating and analyzing these cases, and for performing research on this subject. See Thomas Weaver, "The Part That Counts: Wrongful Incarceration Awards And The Value Of Human Life," (unpublished manuscript) (on file with the authors).

⁵⁴ These torts include wrongful imprisonment, wrongful conviction, wrongful confinement, malicious prosecution, abuse of process, intentional or negligent infliction of emotional distress, false arrest, or an unconstitutional deprivation of their civil rights. See Table A, Appendix II.

damages, punitive damages, or some combination thereof.⁵⁵ Many of these situations involve suits against governmental actors, and sometimes the maximum awards in these cases are fixed by statute.⁵⁶ Other times suit is brought as a common law tort case. Often no award will be given for imprisonment due to a simple, albeit tragic, error; some type of intentional act, malice or malfeasance is required.⁵⁷

We have located payments made in a total of 19 wrongful imprisonment cases. See Table A, Appendix II. The highest payment we found for a case involving at least a year of prison was \$1.138 million per year, for three years of wrongful confinement for a false conviction.⁵⁸ However, when shorter imprisonments are annualized, significantly higher figures sometimes resulted.⁵⁹ By contrast, the lowest payment we found compensated the

⁵⁵ "Losses of this magnitude are almost impossible to catalogue. The loss of liberty. The loss of the enjoyment of their families. The loss of the ability to care for and nurture their children. The loss of intimacy and closeness with their spouses. Indeed, the task of quantifying these losses-which I am obliged to do-is among the most difficult this Court has ever had to undertake. Where triers of fact must assign values to the intangible and invaluable, they may look to the values assigned by other fact-finders in the past. I do not blindly follow other awards, but I do look to them for perspective and as an indication of how society has valued these harms. I note also that damage and suffering do not accrue smoothly and proportionally on a monthly or annual basis. Some injury occurs all in a rush at the start-the shock and horror of arrest and conviction-while other injury only begins to compound after a significant period of time has passed-the setting in of despair, or the withering of relationships. I consider the particular story of this case and these plaintiffs' suffering." See *Limone*, *supra* note 53, at 243.

⁵⁶ See, e.g., 42 U.S.C.A. § 2513 (2009).

⁵⁷ See, e.g., the examples in note 55, *supra*.

⁵⁸ *Bravo v. Giblin*, 2002 WL 31547001, 2002 Cal.App.Unpub. LEXIS 10494 (Cal.App. 2 Dist. 2002). Suit filed under under 42 U.S.C. § 1983 yielded "damages in the amount of \$221,976 for his economic losses, \$3,537,000 to compensate him for 1,179 days of incarceration at the rate of \$3,000 per day, and \$1 million to compensate him for emotional distress suffered between the date of the incident and the date of his sentencing." *Id.* at *24, 2002 Cal.App.Unpub. LEXIS 10494 at *74. We arrived at the award per year of imprisonment of \$1,138,951.77 in this case by multiplying \$3,000 a day by 365.25 to arrive at \$1,095,750. The lost earnings of \$221,976, divided by 1,179 days in prison and multiplied by 365.25 days, comes to \$118.28 per day and adds another \$43,201.77 per year. The total award per year of imprisonment thus comes to \$1,138,951.77.

⁵⁹ See *Mark Diaz Bravo v. Giblin*, 2002 WL 31547001, 2002 Cal. App. Unpub. LEXIS 10494 (Cal. App. 2 Dist. 2002) (investigating officer fabricated evidence) (10 month sentence led to a \$9 million settlement; this is an annual rate of \$10,800,000). Because the emotional stress and discomfort could be disproportionately greater at the beginning of a prison sentence, it is unclear whether the award would have been increased proportionately if the victim had been imprisoned for a year, or for multiple years. As noted, in these cases it is

wrongfully imprisoned person at the rate of only \$23,529 per year.⁶⁰ The 75th percentile of these 19 awards is approximately at the \$1,000,000/year mark; the 25th percentile approximately \$140,000.⁶¹ We should note that these results are complicated and may be ambiguous, however, because these cases often also involved allegations of, and sometimes specific awards for, false arrest, false conviction, overly harsh interrogation techniques, malicious prosecution, and other factors.⁶² Rarely are these awards unambiguously and solely for false imprisonment.

In addition to the 19 final awards, we found many others that were not included in our study because the false imprisonment awards were too confounded with compensation for the initial arrest or were not yet final.⁶³ For a variety of reasons, including our small sample size, the near certainty that our research failed to uncover many cases, the existence of secret settlements, and the confounding of awards for false imprisonment with awards for related torts such as intentional infliction of emotional distress, we present the mean (\$1,266,024, which was significantly affected by two very high annualized awards for imprisonment of less than one year) and median (\$214,286) of these results with great reluctance. Moreover, although some of the plaintiffs were middle class,⁶⁴ none of the wrongfully imprisoned people appear to have been corporate executives or upper class professionals.⁶⁵ It is possible

difficult to segregate the amounts awarded for false imprisonment from the amounts awarded for one time events or other torts. “Where the period of incarceration is shorter (e.g., less than one year), proportionately larger awards (measured by annualizing the award) have been rendered, presumably reflecting Limone's observation that the injury from incarceration may be more intense towards the beginning.” *Smith v. City of Oakland*, No. C-05-4045 EMC, (N.D. Calif. March 17, 2008); 2008 U.S. Dist. Lexis 20735. *See also* John C. Coffee, *Corporate Crime and Punishment*, N.Y.L.J., Nov. 29, 1990, at 431 (noting that “the declining marginal utility of imprisonment means that each increment of incarceration increases the perceived penalty by a less than proportionate amount. Or, reduced to its simplest terms, a two-year prison term is not twice as bad as a one-year term.”).

⁶⁰ *See Avery v. Manitowoc Co.*, 428 F.Supp.2d 891, 893 (E.D. Wis., 2006).

⁶¹ *See* Table A, Appendix II.

⁶² *See e.g.*, For example, one case involved a month in jail and an award of \$355,500 for false imprisonment, as well as “\$71,100 for false arrest; \$71,100 for intentional infliction of emotional distress . . . and \$213,300 for malicious prosecution” *Jones v. City of Chicago*, 1987 WL 19800, *1, 1987 U.S. Dist. LEXIS 10510 at *1 (N.D.Ill, Nov. 10 1987), *aff'd*, 856 F.2d 985 (7th Cir.1988).

⁶³ For examples *see* *Thomas Weaver*, *supra* note 53.

⁶⁴ For example, *see Newsome*, 319 F.3d at 307 (Plaintiff was an unemployed paralegal, although he testified at trial that he was employed at the time incarceration began).

⁶⁵ *See* Table A, Appendix II.

that a jury or judge would award a corporate executive wrongfully imprisoned for price fixing a larger than average amount for their suffering.⁶⁶ Still, these results do tend to show that figures in the neighborhood of \$1 million per year appear generally to be the practical maximum that society is willing to award for a year wrongfully spent in prison.

iv. Estimates by Antitrust Scholars

A third approach is to assemble and analyze similar estimates by scholars. We have been able to find only two estimates for the disutility of a year in prison for an antitrust offense that seem plausible in this context.⁶⁷ Both were made by extremely reputable scholars. Both are roughly consistent with the estimates above.

First, an article by Professors Howard P. Marvel and others equated a year in jail for price fixing to approximately \$600,000 in 2009 dollars.⁶⁸ Another study by Professor Kenneth Glenn Dau-Schmidt and others equated a year in jail for price fixing with a fine of \$1.5 million today.⁶⁹ These figures are higher than the average valuations for a year of life noted earlier, perhaps because price fixers are wealthier on average and can afford to

⁶⁶ It is possible, however, that a jury might react in the opposite direction. A jury might be less sympathetic to imprisoned upper class corporate executives.

⁶⁷ We have found one other estimate, but it seems to value prison time at an unduly low level for white collar criminals. See Tonja Jacobi & Gwendolyn Carroll, *Acknowledging Guilt: Forcing Self-Identification in Post-Conviction DNA Testing*, 102 NW. U. L. REV. 263, 283 & n. 52 (2008) (estimating value of prison at approximately \$200 per day, which amounts to slightly more than \$70,000 per year).

⁶⁸ See Howard P. Marvel, *et al.*, *Price Fixing and Civil Damages: An Economic Analysis*, 40 STAN. L. REV. 561, 573 (1988). The authors equated a year in prison with a \$300,000 fine. The article appeared in the February 1988 issue so we assume they were using 1987 dollars. The Bureau of Labor Statistics Consumer Price Index inflation calculator equates \$300,000 in 1987 to \$563,133 in 2009. See <http://data.bls.gov/cgi-bin/cpicalc.pl>

⁶⁹ Kenneth Glenn Dau-Schmidt, *et al.*, *Criminal Penalties Under the Sherman Act: A Study of Law and Economics*, in 16 RESEARCH IN LAW AND ECONOMICS 25 (Richard O. Zerbe, Jr. ed., 1994) available at http://papers.ssrn.com/sol3/papers.cfm?abstract_id=712721. This article equated a year in jail with a fine of \$1 million. The Bureau of Labor Statistics Consumer Price Index inflation calculator equates \$1,000,000 in 1994 and \$1,438,866 in 2009. See <http://data.bls.gov/cgi-bin/cpicalc.pl> Professors Dau-Schmidt et al. were using 1982 data for much of their paper's analysis. If they meant their valuation of a year in jail to be expressed in 1982 dollars, then their \$1,000 estimate would be the equivalent of \$2,209,740 in 2009. *Id.*

disvalue prison time much more than most people can, or perhaps because price fixers' time is more valuable on average.⁷⁰

v. A Conservative Resolution Of The Issue

These three approaches yield estimates that are broadly consistent with one another. To be conservative, we have taken the highest of these estimates for the disvalue of a year in prison, \$1,500,000 per year, and arbitrarily increase it to \$2 million.⁷¹ We will use this as the disvalue or deterrence equivalent of a year in prison. We will use \$1,000,000 for the disvalue or deterrence equivalent of a year of house arrest. We note that \$2 million is as much as the lowest estimates for the value of a human life noted earlier. We believe these figures are significantly more than the average deterrence effect of a year in prison (or, a fortiori, of a year of house arrest, but we are selecting them so that our methodology will be conservative and as non-controversial as possible).⁷²

Using the assumption that a sentence of a year of incarceration has the same deterrence effect as a \$2,000,000 fine, the collective 330.24 years of prison sentences received by antitrust defendants from 1990 to 2007 would be the equivalent of \$660 million in criminal fines. Using the assumption that a sentence of a year of house arrest has the same deterrence effect as a \$1,000,000 fine, the collective 96.85 years of house arrest received by antitrust defendants from 1990 to 2007 would be the equivalent of another \$97 million in criminal fines. These figures total \$757 million.

As noted earlier, however, penalties directed against the individuals involved might well have more of a deterrence effect than penalties directed against the corporations. To illustrate how this could affect our analysis, we have trebled the deterrence effect of every individual penalty before adding them to the corporate penalties. This means using \$6 million for the deterrence value of a year in prison⁷³ and \$3 million for the deterrence value

⁷⁰ Whether the time or the life of a price fixer is more, or less, valuable than that of an average person is an interesting philosophical question that this article will not explore.

⁷¹ We do not believe \$2 million is the true cost or deterrent value of a year in prison. We nevertheless decided to use this figure, which we believe to be unduly high, in our subsequent analysis in order to take a conservative and relative non-controversial approach to the issue.

⁷² We note that valuing a year's worth of life at \$2 million would mean that a 20 year prison sentence would be valued at \$40 million, a figure far in excess of the amount that society places on an individual's life.

⁷³ We note that valuing a year's worth of life at \$6 million would mean that a 20 year prison sentence would be valued at \$120 million, a figure far in excess of the amount that society places on an individual's life.

of a year of house arrest, and also trebling the \$118 million in individual penalties.⁷⁴ Thus, the \$757 million calculated earlier would be increased to \$2.271 billion, and the \$67 million in individual fines would be increased to \$201 million. Add to these figures the \$4.166 billion in corporate fines and \$118 million in restitution, and the quantifiable deterrence effect of the Antitrust Division's remedies from 1990 to 2007 totals \$6.756 billion.

One final note about DOJ enforcement is appropriate. Its record of overwhelming success suggests the government pursues only very strong cases. Note, for example, that for the years 1992 to 2008, the DOJ filed 699 cases and won 645 cases.⁷⁵ This would appear to translate to a winning rate of over 92%. To be sure, that percentage may be misleading. The cases filed in a given year generally are not the ones resolved in that year. Still, the record suggests that the DOJ wins more than 90% of the time. Such a high success rate means the DOJ does not like to lose. We do not mean this point as a criticism. It may well be appropriate for the government to bring litigation only if it is very confident it will win. But that comes at a cost. The DOJ appears much more willing to tolerate a false negative (a failure to prosecute a violation of the antitrust laws) than a false positive (litigating a case when in fact there was no violation). In other words, it appears the DOJ chooses not to pursue litigation in many meritorious cases, perhaps at least in part because it lacks the necessary resources. This may well create a need for private litigation as a complement to government enforcement of the antitrust laws.⁷⁶

II. Deterrence Effects of Private litigation.

We know of no information concerning how much defendants have paid in total as a result of private antitrust litigation during this same or any other period. We do not even know of extraordinarily rough estimates.

One extremely low floor on this amount, however, can be obtained from the Lande/Davis study of 40 of the largest private antitrust cases that ended between 1990 and

⁷⁴ This assumes that the individuals actually pay their own fines. It is, however, difficult to determine whether the antitrust fines imposed on corporate employees are ultimately paid by the employees, or are often or usually directly or indirectly paid by their employer. This area of law is exceedingly complex, and, of course, even if indemnification is illegal, this does not mean that it does not occur regularly. See 1 ROGER MAGNUSON, *SHAREHOLDER LITIGATION* § 9:37 (West November 2009); Pamela H. Bucey, *Corporate Executives Who Have Been Convicted of Crimes: An Assessment and Proposal*, 24 *IND. L. REV.* 279 (1991); Note, *Indemnification of Directors: The Problems Posed By Federal Securities and Antitrust Legislation*, 76 *HARV. L. REV.* 1403 (1963) .

⁷⁵ *WORKLOAD STATISTICS 1999-2008*, *supra* note 10.

⁷⁶ The ideal proportion of success to failure will depend on a number of variables, including the relative harms from false negative and false positives and the likelihood of false negative to false positives. A full discussion of this issue is beyond the scope of this Article.

2007.⁷⁷ Our primary screen was that each case must have returned \$50 million or more to victims of antitrust violations. Actually, they were “alleged” victims because almost all the cases settled with no finding that defendants had violated the antitrust laws.⁷⁸ We did not want to make subjective judgments over whether to value products at their retail value, their wholesale value, or defendants’ cost. We counted all products as being worth nothing. We did the same thing for coupons or for discounts because they all have uncertain redemption rates: all discounts and coupons were counted as zero.⁷⁹

This study documents between \$18 and \$19.6 billion in cash paid by defendants in these 40 cases alone. Since this total does not include any value for the products, discounts, or coupons received in these cases, and also leaves out defendants’ attorneys’ fees and other litigation costs (including expert witness fees) and the disruptive effects of the litigation on corporate efficiency, it understates the actual deterrence from these cases because all these omitted factors also have deterrence effects.⁸⁰

⁷⁷ This was not a cost/benefit analysis of private enforcement. We made no attempt to assess any of its costs, or all of its benefits. Rather, the main point of this project was to assess those benefits that easily could be quantified. We did not select a random sample of private cases and follow them cradle to grave, assessing the merits or lack of merits of each. This would be difficult to do since almost every private case is dismissed or settles, and for this reason it would be hard to find out the relevant information about each case. We did not limit ourselves to cases where the Court found an antitrust violation because these are rare. Only 24 final cartel cases calculated an overcharge since 1890! *See Connor & Lande, supra* note 16 and for list of cases and their recoveries see Table 7.

⁷⁸ *See Benefits, supra* note 1, at 891 n.46

⁷⁹ We eliminated many cases because they were too difficult to value, even cases valued in the press at more than \$1 billion. Moreover, sometimes it was just not possible to get the necessary information out of old files or from the preoccupied lawyers possessing the necessary information.

We did not adjust the settlements for inflation by raising them to their present value. Nor did we subtract attorneys’ fees or other claims administration expenses because for deterrence purposes, it does not matter what happened to the money paid by Defendants.

We did not attempt to value injunctive relief, even for those cases where a Court characterized this relief as being very important. Although injunctions greatly can benefit both victims and the economy as a whole, we were unable to ascertain an objective and reliable way to quantify the value of injunctive relief. Neither did we attempt to value the injunctive relief secured by the DOJ. For more on our methodology *see Benefits, supra* note 1, at 889-91.

⁸⁰ As noted earlier, injunctive relief secured by these 40 cases also was omitted, further understating the deterrence value of these cases. However, the effects of injunctive relief secured by DOJ cases also was excluded.

In terms of overall deterrence, therefore, these 40 private cases resulted in approximately three times the deterrence of the \$6.756 billion in deterrence produced by every criminal case brought by DOJ during this same period. (As noted earlier, this comparison is not just to DOJ actions involving these 40 private cases; the DOJ total is for every cartel sanction secured by the Division between 1990 and 2007.)

However, not all of these 40 cases were against cartels: some were against monopolies (although none of the many class actions against Microsoft were included due to data problems). Of the total recoveries of \$18-19.6 billion, \$9.2 to \$10.6 billion was paid in 25 cases that were litigated under the per se approach. This sample of 25 cases thus excludes payouts by monopolies. Comparing this \$9.2 to \$10.6 billion to the \$6.756 billion in DOJ deterrence calculated earlier shows that these 25 private cases alone probably deterred more anticompetitive behavior than the entire DOJ criminal antitrust enforcement.

Another comparison involves only cases in which the government obtained some sort of relief. This comparison might appeal to those who praise government action and are skeptical of private enforcement. They might doubt whether the purely private cases were meritorious.⁸¹ As Table 8 reflects, the plaintiffs in the 24 cases validated by some sort of successful government action recovered between \$10.34 and \$11.973 billion. That amount is somewhere between slightly over 150% and 175% of the \$6.756 billion in deterrence produced by every criminal case brought by DOJ during the same period

Yet another interesting comparison is to the 13 cases in the Lande/Davis sample that also involved a DOJ action that resulted in a criminal penalty. These 13 private cases yielded \$5.6 to \$7.0 billion in payments, roughly the same as the \$6.756 billion DOJ total.⁸²

The larger, per se sample surely includes some cases that could not have resulted in criminal penalties, so one could argue that the comparison to only those cases involving criminal penalties is the fairer one. However, not only is criminal conduct anticompetitive; so too is all per se illegal conduct. We should be grateful to the private cases for discouraging any per se illegal conduct. Moreover, DOJ fines must be proven to a criminal standard, while private cases operate under a civil standard. Perhaps the fairer comparison is, after all, to the deterrence from the sample of 25 per se cases, or to the deterrence from all 40 cases. DOJ did little or nothing to discourage the conduct in many of these non-criminal cases. The only deterrence came from the private actions.

⁸¹ It is important to note that, for the reasons discussed in Part III *infra*, almost all of the private cases we included have strong indicia of being meritorious.

⁸² Of note, a better comparison might be limited to the deterrence effect of the DOJ action in those 13 cases, rather than *all* of the DOJ cases in the same time frame.

One could, of course, re-do this analysis using different values for the disincentive effect of a year in jail. For example, instead of our assumed disvalue of \$6 million for a year in prison, one could use a low estimate of \$2 million or a high estimate of \$10 million for a year in prison.⁸³ Similarly, one could use \$500,000 and \$5,000,000 estimates for the deterrence effects of a year of house arrest instead of our \$3 million assumption. Doing this would of course change the total estimated deterrence effects of the DOJ criminal enforcement program. The low estimates would decrease the \$6.756 billion DOJ deterrence estimate to \$4.728 billion. The high estimates would increase the DOJ deterrence estimate to \$8.136 billion. Even these larger figures yield results that are less than the \$9.2 to 10.6 billion secured by the 25 private per se cases, or the \$10.34 to \$11.973 billion paid in the 24 cases that also resulted in government relief, much less the \$18 billion or more from all 40 cases.

Alternatively, one could ask how much a year in prison and a year of house arrest have to be disvalued on average for the deterrence effects of the Antitrust Division's entire anti-cartel program from 1990 to 2007 to equal the deterrence value of the 40 large private cases that concluded during the same period. Since the total corporate fines, individual fines, and restitution from every DOJ case from this period together total \$4.351 billion, only if the deterrence effects of prison was \$36-\$40 million per year on average, and the deterrence effects of house arrest was \$18-20 million per year on average, would the DOJ anticartel program produce as much deterrence as these 40 cases.⁸⁴

III. Were the Private Cases Meritorious?

If the criticisms of private antitrust enforcement noted earlier are correct and private actions often obtain results in cases that lack merit, not only might they fail to discourage anticompetitive behavior, they might discourage legal—and beneficial—conduct. In other words, they might have the opposite of a beneficial deterrence effect! For several reasons,

⁸³ Even the \$ 2 million estimate is as large as some of the estimates of the value of a life according to some of the studies cited earlier. *See supra* notes 27-29. The larger figure of \$10 million would be at the upper end of the range of estimates of the value of a human life calculated by the studies cited earlier. *See supra* notes 27-29. (Is a year in the life of price fixer really “worth” the same as an average human life?) If we were to use the \$10 million figure for the value of a year in prison and \$5 million for a year of house arrest, the deterrence value of all the DOJ anti-cartel programs since 1990 would rise significantly. Instead of \$6.756 billion it would rise to \$8.136 billion, more than the amounts that defendants paid in the 13 private cases that also had a criminal penalty, but less than the deterrence value of the 25 per se cases in the sample, and only half as large as the more than \$18 billion paid in all 40 cases in the sample. *See* tbls. 9 & 10.

⁸⁴ 330.24 years in prison disvalued at \$36-40 million per year = \$11.889-13,210 billion; 96.85 years of house arrest disvalued at \$18-20 million per year = \$1.743-\$1.937 billion. These total \$13.632-\$15.147 billion. Added to the \$4.351 total for corporate, individual fines and restitution, this equals \$18 to \$19.5 billion - roughly the same as the private totals.

however, this concern is likely misplaced, at least with respect to most of the forty cases we studied.

First, even though almost all of the forty cases were only settlements, it should be recalled that a federal judge approved these settlements. While this certainly is not the same as a verdict, a diverse and generally conservative group of federal judges did ratify that the settlements were fair to members of the plaintiff classes. We note that of the 45 federal judges who approved the settlements or otherwise presided over part or all of the cases we studied, 27 were appointed by a Republican President.⁸⁵ We also note that these judges approved these cases during an era where every Supreme Court antitrust decision has been decided in favor of the defendant. Each of the last 15 antitrust decisions, by a court rated by Judge Posner as the most conservative since 1930,⁸⁶ including every case decided after 1992, ruled against plaintiffs.⁸⁷ Given that this tide of pro-defendant instruction effectively tells the lower courts how to decide close cases, and given the high percentage of judges presiding in the litigation we studied were appointed by Republican Presidents, one would not expect approval of the class action settlements would be based on any pre-existing excessive sympathy for plaintiffs' attorneys.⁸⁸

⁸⁵ See tbl. 10.

Gavil, *Antitrust Book Ends: The 2006 Supreme Court Term in Historical Context*, 22 ANTITRUST 21, 22 (2007) ("The last clear plaintiffs' victories in the Court occurred in 1992 in two cases, *Eastman Kodak Co. v. Image Technical Services*, 504 U.S. 451 (1992); . . .").

⁸⁸ See tbl. 10. We do not mean to suggest that judges act on crass political commitments in presiding over litigation or that party affiliation correlates perfectly with attitudes toward plaintiffs in class actions. Our point is that our analysis is supported to the extent party affiliation might serve as an extremely crude and rough check on whether the judges in the cases we studied were unduly sympathetic to class counsel's efforts.

Second, a large number of the opinions in the forty cases contain generous and gratuitous praise for the plaintiffs' counsel handling the case.⁸⁹ Of the eight judges from whom we were able to discover explicit and generous praise for the conduct of plaintiffs' attorneys (in none of the cases did we discover criticism), five were appointed by a Republican president.⁹⁰ This too helps give assurance that the cases brought by private counsel generally were in the public interest.

Third, an advantage of our selecting only cases that returned more than \$50 million in cash benefits to victims is that this screens out nuisance settlements. We are very skeptical about claims that defending these suits often costs innocent firms \$10 million or more. We would believe this only for very unusual cases. Regardless, \$50 million should be well above the nuisance value of an unmeritorious case. Moreover, the majority of the cases we studied (22/40) settled for more than \$100 million.⁹¹

Fourth, since actions that settle for more than \$50 million are not nuisance lawsuits, the recoveries almost surely reflect the defendants' perception that they could well lose on the merits, not only at trial but also on appeal. To be sure, some may assert that defendants settle regardless of the merits of their cases simply because they are risk averse. This sometimes may be true. Of course, the risk to which they are averse is that they may lose. Moreover, plaintiffs—or, in contingency fee cases, plaintiffs' counsel—also tend to be averse to risk, probably more so than defendants. Plaintiff's lawyers often pay millions of dollars toward the costs of litigation—both in terms of out of pocket expenses and in terms of the implicit value of thousands of hours of their time—all of which will be uncompensated if the case proceeds to trial and defendants prevail. This could give plaintiffs attorneys an incentive to settle for amounts that are too low. Defendants' attorneys, by contrast, are paid by the hour, so they do not have the same kind of risk aversion incentives. In sum, there is no basis for believing that defendants are more risk averse than plaintiffs. If anything, we believe the reverse could well be true.⁹² For these reasons the amount of settlements is at least as likely to be too low as too high.⁹³

⁸⁹ For examples see *Benefits*, *supra* note 1, at 903-04.

⁹⁰ See *Benefits*, *supra* note 1, at 903-04 and tbl. 10.

⁹¹ It is difficult for a firm to believably claim, in effect: "We are saints who did absolutely nothing wrong. Nevertheless, we paid \$50 m or \$100 m or more just to make the case go away." While we are not saying this can never happen, as the settlements get higher, this argument loses credibility.

⁹² It could be argued that plaintiffs' attorneys sometimes have an incentive to "sell out their clients" by settling for too low an amount, too quickly, that their incentive is just to take less money than the victims deserve and then to move on to the next case. Moreover, in class action cases, plaintiffs have difficulty effectively policing their counsel so the possibility of settlements that are too quick and too low is a serious one. By contrast, it could be argued that defense lawyers have the incentive to delay and reject reasonable offers and thereby bill as many hours as possible, even if defendants' clients are in a better position to oversee their attorneys' activities than plaintiffs. For a further discussion of these issues see Joshua P.

A final reason to believe that the cases we studied were generally meritorious is that most were validated in whole or in part other than through settlement in private litigation. This validation took various forms:

1. In 13 of the 40 cases (32.5%), defendants or their employees were subject to criminal penalties, generally through guilty pleas.
2. In 12 of the 40 cases (30%), government enforcers obtained a civil recovery, usually in the form of a consent order.
3. In 9 of the 40 cases (22.5%), plaintiffs survived or prevailed on a motion for summary judgment (or partial summary judgment).
4. In 9 of the 40 cases (22.5%), defendants lost at trial in the private litigation or in a closely related case.
5. In at least 3 out of 40 cases (7.5%) plaintiffs survived a motion to dismiss.⁹⁴

In sum, 34 of the 40 cases (85%) had at least one of these indicators that plaintiffs' case was meritorious. (This total would be 33 of the 40 cases if the motions to dismiss are not included. The percentages appear to total more than 100% because 8 of the 40 cases involved more than one basis for validation.) Table 12, below, summarizes this information. Table 13 in the Appendix lists the cases in which the merits received each kind of validation.

Table 12: Summary of Kinds of Validation in Cases

Kind of Validation of Merits	Number of Cases
Criminal Penalty	13 out of 40 (32.5%)
Government Obtained Civil Relief	12 out of 40 (30%)
Defendants Lost Trial in Same or Related Case	9 out of 40 (22.5%)

Davis and Eric L. Cramer, *Of Vulnerable Monopolists?: Questionable Innovation in the Standard for Class Certification in Antitrust Cases*, 41 RUTG. L. J. __, __-__ (forthcoming 2010); Joshua P. Davis and Eric L. Cramer, *Antitrust, Class Certification, and the Politics of Procedure*, 18 GEO. MASON L. REV. __, __-__ (forthcoming 2010).

⁹³ Others may also say that defendants worry that they will lose when they should not. This raises a philosophical issue. If the courts say conduct violates the antitrust laws, and if even an appellate court, perhaps even the Supreme Court, confirms liability, is it meaningful to say that the outcome is wrong? For practical purposes, we adopt a positivist's view and suggest that the law is whatever the ultimate court declares it to be. Any other perspective would make a study like ours infeasible.

⁹⁴ In fact, the percentage of cases in which plaintiffs survived a motion to dismiss may be higher. We did not consistently note this aspect of the litigation we studied.

Ps Survived or Prevailed at Summary Judgment	9 out of 40 (22.5%)
Ps Survived Motion to Dismiss	3 out 40 (7.5%)
At Least One Basis for Validation	34 out of 40 (85%)
At Least One Basis for Validation, not including surviving motion to dismiss	33 out of 40 (82.5%)

Ultimately there is no way to prove or fully refute assertions that many or most private cases are unmeritorious and are tantamount to extortion. But the above analysis offers reasons to conclude that all of the cases we studied involved legitimate claims, and there is no reason to believe otherwise beyond defendants' self-serving assertions.

IV. Qualifications and Caveats

Throughout this article we have explicitly or implicitly added a large number of qualifications and caveats to our analysis. Some of the most important are worth recapitulating briefly so the conclusions presented in the next section can be assessed fairly.

Concerning DOJ enforcement: Corporate criminal fines, and all restitution and payments in private cases, are made by the corporations involved. Prison terms and house arrests (which are virtually impossible to value accurately) are served by the individuals involved, and the individual fines are often paid by the individuals involved.⁹⁵ We are adding the deterrence effects of all these together to arrive at a measure of total deterrence. We are implicitly assuming that the corporations involved are profit-maximizing and that the executives involved care what happens to their employer. We recognize there are agent/principle problems and behavioral economics issues as well. As noted above, some executives may care only or primarily about the sanctions directed against them as individuals; some may care equally what happens to their employer (either out of professional pride, corporate loyalty, or because of how a corporate sanction could affect their career); other executives might care about both, but weigh the individual sanctions more heavily. To these agent/principle problems we have arbitrarily tripled the deterrence effects of the individual sanctions (prison, house arrest and fines) compared to the corporate payouts (fines, restitution, and payouts in private cases).

⁹⁵ For a discussin as to whether the antitrust fines imposed on corporate employees are ultimately paid by the employees, or are often or usually directly or indirectly paid by their employer, *see* note 81, *supra*.

Concerning private enforcement: The \$18-19.6 billion in payments made in 40 large private antitrust cases is only an extremely low floor on the total deterrence effects of private antitrust enforcement, for many reasons. While these were among the largest private antitrust cases brought during the relevant time period, surely the total paid by defendants in the thousands of private antitrust cases that ended during this period was many times as large. This total also omitted the deterrence value of the products, discounts, services, and coupons that were part of the relief in these cases.

Concerning the DOJ/private comparison: The comparison of the relative deterrence from private and DOJ cases did not attempt to value the injunctive relief or legal precedent obtained in either type of case. The deterrence effects of defendants' attorneys' fees and the stress and time involved for defendants in defending both the DOJ and the private cases also has been omitted. These are significant omissions. This paper's analysis assumes the effects of these omitted factors would be the same for both private enforcement and DOJ enforcement, but we know of no way to ascertain whether this is true.⁹⁶

Further, reasonable people could dispute who first discovered some of the violations that gave rise to the sample of 40 large private cases. The Lande/Davis study concluded, on the basis of admittedly imperfect public information and interviews with attorneys, that sixteen of these 40 cases originally had been discovered by private parties and their counsel, ten were follow-ons to government enforcement actions, and the others had mixed or uncertain origins. This figure for follow-on cases of 10/40, or 25%, is consistent with a survey by Kauper & Snyder which found that only 20% of private cases were follow-on cases.⁹⁷ Moreover, at least nine of the private follow-on cases (9/40 or 22.5%) were significantly broader than the DOJ case: they involved more defendants than the DOJ case, more causes of action, greater relief (in some instances the only relief), or longer periods of illegality.⁹⁸

Even if, contrary to our findings, every private antitrust violation originally was uncovered by the DOJ (even for private actions where the DOJ never filed a case) this would not detract from the important deterrence provided independently by the private actions in these cases. If there has been no private enforcement, this deterrence never would have

⁹⁶ The only indication of the relative value of the precedents that were established comes from the Calkins study, *supra* note 11, which concludes that the most important precedents in recent years were established through private litigation.

⁹⁷ See John C. Coffee, Jr., *Understanding the Plaintiff's Attorney: The Implications of Economic Theory for Private Enforcement of Law Through Class and Derivative Actions*, 86 COLUM. L. REV. 669 n. 36 (1986) ("Although the conventional wisdom has long been that class actions tend to 'tag along' on the heels of governmentally initiated suits, a recent study of antitrust litigation by Professors Kauper and Snyder has placed this figure at '[l]ess than 20% of private antitrust actions filed between 1976 and 1983.'" (quoting Moore, *Data Galore in Georgetown Damage Study*, LEGAL TIMES, Nov. 4, 1985, at 24, col. 4)).

⁹⁸ See *Benefits*, *supra* note 1, at 910 tbl. 6.

arisen. Of course, if all 40 violations had first been discovered by the DOJ, it would complicate an analysis of the relative deterrence effect of private and public antitrust enforcers.⁹⁹ But important deterrence effects from private enforcement - in a system that already had public enforcement - would remain.

Another general caveat concerns how, from a deterrence perspective, perceptions are more important than the realities this article has attempted to document. For example, Professor Stephen Calkins, who is from Detroit, noted the extraordinary prominence in Michigan of Alfred Taubman. Calkins said that the extensive press coverage of Mr. Taubman's being sent to (and later released from) prison for an antitrust offense sent a message to business leaders that no imaginable fine could equal.¹⁰⁰ In this regard, some of the stereotypes about private enforcers also could help to deter antitrust violations. Irwin Stelzer articulated the widely held belief: "An army of private enforcers, enlisting help from attorney-entrepreneurs free to accept cases on a contingency fee basis, freed of 'loser pays' obligations, is an important supplement to those limited [government] resources."¹⁰¹ Although defendants to a large extent have succeeded in portraying plaintiffs' attorneys as the modern economies' bogymen, their fears of this swarming private "army" might do a great deal to discourage anticompetitive conduct, despite the fact that many recent court decisions have weakened private enforcement substantially.¹⁰²

⁹⁹ The DOJ should get partial credit for any cases they uncovered or helped to uncover even if the private parties secured the bulk of the sanctions. Each type of plaintiff might make a different contribution to the deterrence mix. As we noted in *Global Competition Litigation Review*: "[i]n fact, there are many reasons to believe that private antitrust or competition actions complement government enforcement in important ways. As a practical matter the government cannot be expected to do all or even most of the necessary enforcing for various reasons including: budgetary constraints; undue fear of losing cases; lack of awareness of industry conditions; overly suspicious views about complaints by 'losers' that they were in fact victims of anticompetitive behavior; higher turnover among government attorneys, and the unfortunate, but undeniable, reality that government enforcement (or non-enforcement) decisions are at times politically motivated. Not surprisingly, a vigorous private antitrust or competition regime is likely to confer significant benefits over and above those conferred by a system reliant solely upon government enforcement." Robert H. Lande & Joshua P. Davis, *Of Myths and Evidence: An Analysis of 40 U.S. Cases for Countries Considering a Private Right of Action for Competition Law Violations*, *GLOBAL COMPETITION LITIG. REV.* (forthcoming 2009).

¹⁰² See *supra* note 43 and accompanying text.

Finally, this paper is not attempting to perform a cost/benefit analysis of private antitrust enforcement. Many others have asserted problems with private enforcement (although without any systematic evidence), and we readily agree that some private cases have not been in the public interest. Nevertheless, we believe the debate over private antitrust enforcement deserves balance.

V. Conclusions

Our primary conclusion is that the benefits of private antitrust enforcement are substantial and underappreciated. The importance of private enforcement to compensation perhaps requires little elaboration because there is no meaningful alternative means for victims of anticompetitive behavior to recover for the harm they suffered as a result of antitrust violations. Perhaps more surprisingly, there is evidence that private antitrust enforcement does more than DOJ criminal enforcement to deter anticompetitive behavior.

It is, of course, extremely difficult to isolate successes in the antitrust world. Even if a particular private case succeeded in forcing violators to surrender \$100 million or more to their victims, it often would be reasonable to credit many parties in addition to the victims and their counsel. A case could rely in whole or in part on a conspiracy uncovered or partly uncovered by an earlier DOJ investigation, as well as on a legal precedent established by a State Attorney General in an unrelated case, and the case itself could have been financed by private counsel who were able to do so only because of their success in a prior private litigation. As always, success has many parents. Rather than enter into fruitless arguments about which type of enforcement is entitled to what percentage of the credit, and, regardless whether viewed from a deterrence or compensation perspective, perhaps the safest conclusion is that private enforcement is an important complement to government enforcement.

Moreover, the cost to the taxpayer of the deterrence and compensation that arises from private enforcement is practically nonexistent. The only cost to the taxpayer is the cost of maintaining some portion of the judicial system. This amounts to only a tiny fraction of the benefits of private enforcement, and would be incurred even if all these cases were brought by government enforcers.

In addition, the high success rate of government litigation suggests that in the absence of private litigation, many bad actors would get away with violating the antitrust laws. In most cases, if the law is somewhat unclear, or the evidence of illegal conduct is not absolutely compelling at the outset of a legal action, the DOJ does not seem to be willing to pursue litigation. This may well be the appropriate approach for the government to take. But it holds the potential for antitrust laws to go largely unenforced.

Within this context, private litigation of the antitrust laws seems to play a crucial role. In the United States the anticompetitive conduct that gives rise to government enforcement

currently occurs far too frequently and is almost certainly significantly underdeterred¹⁰³ - even factoring in the effects of the present system of private litigation. A fortiori this conduct would be even more undeterred if the United States eliminated or substantially curtailed private enforcement. We would be surprised if firms in other nations were significantly more law abiding than U.S. firms, and suspect that the United States record of underdeterrence of anticompetitive conduct (and undercompensation of victims) exists in many if not most other nations as well. Although each nation has unique needs, history, institutions, capabilities and circumstances, and we would never advocate a “one size fits all” approach to competition legislation, we do urge every nation without private enforcement of its competition laws to seriously consider permitting victim suits.¹⁰⁴

¹⁰³ See Lande, *supra* note 14, at (“. . . antitrust damages levels should be raised so that they do result in the effective treble damages necessary to insure optimal deterrence of anticompetitive conduct . . .”); *see also* Connor & Lande, *supra* note 16, at 560 (“If the worldwide system of criminal fines can be made to correspond more closely to the actual levels of cartel overcharges, sanctions against price-fixing will more closely provide optimal deterrence.”).

¹⁰⁴ Europeans often believe that public enforcement should be concerned with deterrence while private enforcement should be concerned with compensation of victims. See Wouter P. J. Wils, *The Relationship Between Public Antitrust and Private Actions for Damages*, 32 *World Competition*, 3 (2009), *passim* and especially 12-15. We believe that the deterrence effects of private enforcement should be given greater consideration.

Appendix I Tables

Table 1: Total Corporate Antitrust Fines 1990-2007.¹⁰⁵

The following figures are from a variety of different sources published at different times. We found results for some years from some sources that contradicted results given by different sources, for reasons we could not determine. The figures in the following table are our best attempt to reconcile these sometimes conflicting data sources.

<u>Year (Fiscal)</u>	<u>Total Corporate Fines (\$000)</u>
1990	22658
1991	17573
1992	22430
1993	40427
1994	38996
1995	40222
1996	25245

Table 2: Total Individual Antitrust Fines 1990-2007.¹⁰⁶

The following figures are from a variety of different sources published at different times. We found results for some years from some sources that contradicted results given by different sources, for reasons we could not determine. The figures in the following table are our best attempt to reconcile these sometimes conflicting data sources.

<u>Year (Fiscal)</u>	<u>Total Individual Fines (\$000) from 1990-2007</u>
1990	917
1991	2806
1992	1275
1993	1868
1994	1240
1995	1211
1996	1572
1997	1247
1998	2499
1999	12273
2000	5180
2001	2019
2002	8685
2003	470
2004	644
2005	4483
2006	3650
2007	15109
Total	\$67,148,000

¹⁰⁶ U.S. DEP'T OF JUSTICE, ANTITRUST DIVISION WORKLOAD STATISTICS FY 1990-1999, 12, available at, <http://www.justice.gov/atr/public/246419.pdf>; U.S. DEP'T OF JUSTICE, ANTITRUST DIVISION WORKLOAD STATISTICS FY 1999-2008, 12, available at, <http://www.justice.gov/atr/public/workstats.pdf>.

Table 3. Total Restitution 1990-2007.¹⁰⁷

Year	Restitution Imposed in Connection with Criminal Antitrust Cases (\$000)
1990	5670
1991	3185
1992	3550
1993	950

Appendix II: Table A and Accompanying Notes

Table A. Monetary Valuation of Prison Time Established Through False Imprisonment Litigation.

Plaintiff	Imprisonment	Total Award	Award per year	How Finalized?
Raul Ramirez	10 months	\$9,000,000.00 (settlement)	\$10800000.00	Phone Interview
George Jones	1 month	\$355500.00	\$4266000.00	Phone Interview
Kerry Edwards	30 days	\$327,500.00 (settlement)	\$3875416.66	Phone Interview
Mark Diaz Bravo	1,179 days	\$3676451.90	\$1138951.77	Phone Interview
James Newsome	15 years	\$15000000.00	\$1000000.00	Phone Interview
Stephan Cowans	6.5 years	\$3,200,000.00 (settlement)	\$492307.69	Published case
Ellen Maria Reasonover	16 years	\$7,500,000.00 (settlement)	\$468750.00	Published case
Eddie Joe Lloyd	17 years	\$6,000,000.00 (settlement)	\$352941.17	Published case
Neil Miller	10.5 years	\$3,200,000.00 (settlement)	\$304761.91	Published case
Larry Mayes	21 years	\$4,500,000.00 (settlement)	\$214285.72	Published case
Eduardo Velázquez	14 years	\$ 2,450,000.00 (settlement)	\$175000.00	Published case
Bruce Godschalk	15 years	\$2,340,000.00 (settlements)	\$156000.00	Published case
Clarence Elkins	7 years	\$ 1,075,000.00 (settlement)	\$153571.43	Published case
Olmedo Hidalgo	14 years	\$2,000,000.00 (settlement)	\$142857.15	Published case
Kerry Kotler	10 years 8 months	\$1510000.00	\$141563.385	Published case

Robinson	14 years	\$1,750,000.00 (settlement)	\$125000.00	Published case
Michael Green	13 years	\$16,00,000.00 (settlement)	\$123076.92	Published case
Darryl Hunt	19.5 years	\$ 1,958,454.00 (settlement)	\$100433.54	Published case
Stephen Avery	17 years	\$400,000.00 (settlement)	\$23529.41	Published case

Notes for Table A -- Following is a list of cases included in Table A. This contains the researcher's methodology notes and other general case notes.

1. Raul Ramirez.¹¹¹ The verdict in this case was \$18 million dollars, but settled for \$9 million.¹¹² Ramirez was a 25 year old special education teacher.¹¹³ 8 months after the attempted rape of a 16 year old girl, the police arrested Raul Ramirez who spent 10 months incarcerated awaiting trial.¹¹⁴ He was found factually innocent and sued for false arrest and malicious prosecution.¹¹⁵ This case was cited by the *Limone* district court case as one of several cases in recent years where courts have awarded compensation of more than \$1,000,000.00 per year of wrongful incarnation.¹¹⁶

2. **George Jones.**¹¹⁷ The defendant fully satisfied this judgment.¹¹⁸ We include only the false imprisonment portion of \$355,500 and exclude the \$71,100 for false arrest, \$71,100 for intentional infliction of emotional distress, \$213,300 for malicious prosecution, \$90,000 in punitive damages,¹¹⁹ and \$271,188.75 in attorneys fees.¹²⁰ The police failed to turn over exculpatory evidence in a rape and murder case against George Jones, who was a high school student at the time of arrest.¹²¹ This case was found via a citation by the district court in *Limone*.¹²²

3. **Kerry Edwards.**¹²³ The settlement is ambiguous as to the portion of the award pertaining to false imprisonment and the portion of the award pertaining to civil rights violations.¹²⁴ Kerry Edwards was misidentified as the subject of an arrest warrant and held for 30 days.¹²⁵ At Edwards' insistence, an independent investigator wrote a report within three days confirming that Edwards' had been misidentified. However, the report was ignored for several weeks while Edwards continued to be incarcerated.¹²⁶ This verdict summary was found by running a Westlaw verdict search.¹²⁷

4. **Mark Diaz Bravo.**¹²⁸ This award was satisfied by the Defendant.¹²⁹ The total award of \$3,676,451.90 was calculated by taking the \$3,000.00 per day awarded by the court for 1,179 days in prison and adding the court's \$221,976.00 award for lost earnings.¹³⁰ An award of \$1,000,000 for time spent in prison before conviction was not included in our calculations.¹³¹ Mark Diaz Bravo was a nurse falsely convicted of raping a patient.¹³² This case was cited by the *Limone* case.¹³³

5. **James Newsome.**¹³⁴ The award was fully satisfied.¹³⁵ In addition to \$1,000,000 per year of imprisonment, the jury awarded \$850,000 total in attorneys fees, which we did not include in our calculations.¹³⁶ The jury found that officers violated Newsome's civil rights by inducing three witnesses to falsely testify against him.¹³⁷ James Newsome was an unemployed paralegal at the time of arrest. However, although he testified that he was still employed, the court held that this did not require a new trial.¹³⁸ This case was cited by the *Limone* case.¹³⁹

¹²³ Edwards v. Freehold Township, No. 3:07-cv043763-MLC-TJB, 2006 WL 4587710 (D.N.J. 2006) (VerdictSearch settlement summary).

¹³⁷ See id. at 302.

¹³⁸ Id. at 307.

¹³⁹ See Limone 579 F.3d at 106.

6. **Stephen Cowans.**¹⁴⁰ Although Cowans only served 6.5 years, he was sentenced to 35-50 years for murder, which was a factor in the amount of the settlement.¹⁴¹ The Boston police department used faulty finger printing techniques as evidence at Plaintiff's trial. Plaintiff was released as a result of DNA testing released by the innocence project in January 2004. That same year, Boston's fingering printing department was closed for two years. It reopened in 2006 after heavy audits of its internal procedures.¹⁴² This verdict summary was found through a Westlaw verdict search.¹⁴³

7. **Ellen Maria Reasonover.**¹⁴⁴ Reasonover was falsely convicted of murder at an unfair trial where hearsay evidence was allowed. Her conviction was overturned and she settled her case with the city. Found through a Westlaw verdict search.¹⁴⁵

8. **Eddie Joe Lloyd.**¹⁴⁶ Lloyd was exonerated by DNA evidence of the rape and murder of a 16 year old girl.¹⁴⁷ This settlement summary was found by running a Westlaw verdict search.¹⁴⁸

9. **Neil Miller.**¹⁴⁹ Miller was exonerated by DNA evidence.¹⁵⁰ This verdict summary was found by running a Westlaw verdict search.¹⁵¹

10. **Larry Mayes.**¹⁵² Originally, a jury verdict of \$9,000,000 was reached, but was appealed by Defendant. The 7th circuit stayed its judgment on appeal to allow the parties to
