This manuscript, entitled *Federal Healthcare Leadership Skills Required in the 21st Century*, is a full-length empirical study. The domain is health services, specifically, the application of knowledge toward improving healthcare administration. The word count of the manuscript is 4397. This study adhered to the Ethical Principles of Psychologists and Code of Conduct. Institutional Review Board approval was not applicable.

This study addresses an important national issue by identifying the skill sets that will be needed by federal healthcare leaders to transform our national focus from healthcare to health. As suggested by this study, this transformation requires new skills to have a positive impact on the health of our nation’s diverse communities and the fiscal health of our national economy. Specifically, this study identifies twelve skills required of federal healthcare leaders to succeed in coordinating health care within and between federal agencies.

There appear to be few studies or articles addressing these skill sets, especially as related to federal healthcare organizations. Therefore, this study’s findings should support healthcare leaders to lead their federal agencies in transforming to the most effective and efficient system for the health of our nation.

Thank you for your consideration.

Sincerely,

Ronald P. Hudak, JD, PhD, FACHE
