COMMUNITY-BASED PARTICIPATORY DEVELOPMENT OF A COMMUNITY HEALTH WORKER MENTAL HEALTH OUTREACH ROLE TO EXTEND COLLABORATIVE CARE IN POST-KATRINA NEW ORLEANS

**Objectives:** The REACH NOLA Mental Health Infrastructure and Training Project (MHIT) aimed to reduce disparities in access to and quality of services for depression and post-traumatic stress disorder (PTSD) in post-Katrina New Orleans by developing a mental health outreach role for community health workers (CHWs) and case managers as a complement to the collaborative care model for depression treatment.

**Intervention:** Community agency leaders, academics, healthcare organizations, and CHWs engaged in a community participatory process to develop a CHW training program.

**Design:** A review of qualitative data including semi-structured interviews, project team conference calls, email strings, and meeting minutes was conducted to document CHW input into training and responses to implementation.

**Results:** CHW contributions resulted in a training program focused on community engagement, depression screening, education, referral assistance, collaboration with clinical teams, and self-care. CHWs reported use of screening tools, early client successes in spite of challenges with client engagement, increase in networking and collaboration with other community agencies and providers, and ongoing community hurricane recovery issues.

**Conclusions:** This intervention development approach and model may be used to address post-disaster mental health disparities and as a complement to traditional implementation of collaborative care. (Ethn Dis. 2011;21[Suppl 1]:S1-45–S1-51)

**INTRODUCTION**

Underserved communities are at high risk for poor access to quality care for common mental disorders such as depression and posttraumatic stress disorder (PTSD), particularly following exposure to disasters such as the 2005 Gulf storms. Evidence-based quality improvement programs such as collaborative care approaches that integrate primary care providers, patient care managers, and mental health specialists into patient-focused teams increase access to services and improve health and employment outcomes for depressed and anxious primary care patients, including underserved groups. However, such programs may be difficult to implement in public sector agencies and those damaged by disaster, owing to resource and infrastructure limitations. Secular and faith-based social service organizations often have infrastructure for post-disaster outreach, case management, and medical care that could support quality improvement, but staff and administrators may lack adequate training to address mental health issues, facilitate appropriate referrals for care, and help affected persons overcome mental health related stigma.

Health and social service agencies often utilize community health workers (CHWs) – personnel who provide fellow community members with health services including education and healthcare referrals – to fill unmet public health needs in underserved communities. CHW engagement is a promising strategy to overcome disaster-resultant healthcare infrastructure limitations in contexts such as post-Katrina New Orleans, where the shuttering of healthcare facilities and exodus of providers diminished local capacity to address well-documented unmet, ongoing mental health needs. CHW facilitation of early entry into appropriate care for community members with mild to moderate symptoms of anxiety, depression, and trauma may prevent serious mental health sequelae and subsequent use of emergency health services. CHW provision of peer-to-peer support for fellow community members may fill gaps in availability of traditional counseling services, and their participation as members of collaborative mental health treatment teams could increase patient engagement, leading to increased efficacy of care delivery. Previous CHW participation in addressing community mental health needs has included application to homeless or severely mentally ill populations, international settings, and...
We report on the process of our mental health outreach model development and early experiences with implementing a training program to address these feasibility and potential effectiveness issues.

METHODS

Community-based participatory research (CBPR) approaches have been recommended to address health disparities, particularly in groups with historical distrust in research and services. This approach has been applied to mental health services research, and was the basis for development of the participatory REACH NOLA partnership that led the Mental Health Infrastructure and Training Project (MHIT).

Training Development

Initiated in May 2008, MHIT aimed to address limitations in access and quality of mental health care for New Orleans area hurricane survivors by providing staff and administrators at social service and safety-net agencies with multi-day training seminars and follow-up technical support in evidence-based practices for treatment of depression and psychological trauma. Approximately 400 therapists, psychiatrists, primary care providers, care managers, administrators, CHWs, and case managers employed by 70 participating institutions attended team-focused sessions on implementation of collaborative care for depression that included: overview of the collaborative care model; implementing system change through structured quality improvement methods; improving care coordination and communication between clinical providers; strategies for assembling a collaborative care team; networking with other community providers; and quality improvement methodology.

Profession-specific collaborative care competencies were developed through: instruction of medication management principles for primary care providers; therapist training in administration of evidenced-based therapy; and care manager sessions on coordination of depression treatment.

The addition of CHWs as members of the collaborative care team required the development of a CHW-specific training curriculum and resources. A work group of community and academic MHIT project co-leads, and New Orleans-based CHWs engaged in a participatory, iterative process with the goal of developing a sustainable, culturally competent CHW training program for mental health outreach. Work group collaborators sought to: 1) be responsive to community needs and acknowledge community strengths; 2) be consistent with key components of the collaborative care model of chronic disease management such as promoting evidence-based treatments, care coordination, and patient participation; 3) build on existing CHW models that address health disparities; and 4) support CHW-patient engagement in nonclinical settings to contribute to patient education that results in an increase in the utilization of evidence-based screening tools, and to contribute to the referral of patients into treatment, which may be critical to bringing underserved populations into appropriate care.

Sixty-two CHWs and case managers attended the first three MHIT training seminars held between July 2008 and February 2009. Trainers used didactic instruction, role-playing and discussion at Training 1 to demonstrate the use of depression screening tools and teach principles of community engagement; at this time participants and trainers identified a need for additional instruction to address more adequately community concerns. All participants in Trainings 1 through 3 were invited to contribute to a revised CHW mental health outreach curriculum by providing insights on community context and feedback on training materials and resources. The project team altered training topics, techniques, and materi-
als in response to CHWs’ goals and concerns.

All information presented at trainings was documented in a written manual and distributed with a CD of resources and a client education DVD. CHWs received a book on depression education and treatment options, including collaborative care26 and community resource guides describing low- or no-cost social services resources to address client needs.

Partnered Working Group Qualitative Assessment

We conducted a qualitative review of CHW input into training development and responses to training and implementation using a partnered working group approach.27 Data sets were reviewed by two-member work group teams, with each member independently reviewing the source material. We analyzed blinded data from all sources of CHW feedback that included: minutes taken during 20 CHW-specific breakout sessions during Trainings 1, 2, and 3; 12 MHIT project team weekly conference calls among academic and community partners including CHWs; three CHW support calls, in which academic partners provided CHWs with post-seminar technical assistance for implementation of outreach techniques and use of screening tools; 31 email strings from project team members, including CHWs; and five semi-structured telephone interviews of CHWs who participated in the training seminars and support calls.

A structured form was developed to record themes and text examples based on the analysis questions. Then team members together reviewed all documents to identify common and uncommon themes and associated citations. Authors integrated these summaries to reduce redundancies and clarify distinct themes.28

No financial incentives were offered to participants. Research procedures were found to be exempt from review by IRBs at RAND, Tulane University, and the University of Washington.

RESULTS

Community input into training development is summarized in Table 1. CHWs revealed the following primary concerns: complex post-hurricane challenges; need for services for vulnerable populations; continuing stressors such as concern about future hurricanes; frustration with inability to satisfy clients’ financial needs; difficulty responding to suicidal clients; and concern about existing community and agency capacity, resources, and infrastructure to support mental health services and referrals. CHWs and case managers reported strengths in the areas of trust-building with clients, knowledge of the community, and flexibility. Many CHWs described difficulty accommodating the stresses of being on the front line, facing personal recovery needs, and lacking time or resources to get help for personal recovery. CHWs requested instruction in self-care techniques to cope with personal and work-related stress.

Table 2 summarizes findings concerning CHW responses to the training. The CHWs generally offered positive feedback on the training content and valued both guided role playing and follow-up support calls. They reported using PHQ-229 and PHQ-930 screening questionnaires. To increase community acceptability, some rephrased screening questions to include colloquial language, or they incorporated screening questions into informal conversations. Although most CHWs were familiar with employers’ existing privacy policies, some CHWs identified confidentiality/HIPAA training as useful – particularly role playing the application of policy and tools. Training in problem-solving skills and behavioral activation support was novel for most CHWs, and use of these techniques was noted in follow-up support calls. CHWs offered specific suggestions for improvement of training and materials such as inclusion of additional role-playing sessions, emphasizing cultural competence and networking, simplifying the case registry form, and integrating training for CHWs and therapists. CHWs identified a number of challenges to conducting outreach and client follow-up, including difficulty of reaching clients, stigma, lack of community infrastructure, job conditions, and barriers to collaboration. Training participants acknowledged five types of positive training impact: increased delivery of high-quality care, improved networking opportunities, increased respect for providers, assistance with continuing education requirements, and increased hope for community mental health recovery.

The final CHW training curriculum contained modules that covered: overview of depression and PTSD; techniques for building trust with clients; instruction in use of PHQ-2 and PHQ-9 depression screening tools; community resources for referring depressed patients; skills for problem-solving and behavioral activation, which were adapted from psychotherapy trainings in other collaborative care initiatives; self-care for community health workers; community education techniques; and tools for tracking client services and outcomes.

DISCUSSION

This project aimed to expand the implementation of collaborative care for depression through a community-partnered, participatory approach to developing and evaluating a culturally appropriate mental health training program for CHWs and case managers in post-Katrina New Orleans. The effort integrated principles of collaborative care, CHW models for other health conditions, and participatory planning. The result, a program presented in a
training manual is itself an important addition to the public mental health field, building on prior documented approaches. Early feedback suggests that CHW participation in post-disaster mental health outreach may bolster community resilience by increasing interagency collaboration, building trust, and alleviating mental health-associated stigma.

Data from the partnered evaluation of the program suggest that the two-way knowledge exchange between community and academic partners enabled the development of a community-relevant program informed by experts in local context. We were encouraged that a participatory model was effective in supporting program development in a short time period, and for a stigmatized issue in the context of a historically underserved community following a major disaster. Consistent with participatory research principles, it was possible to develop awareness of the many challenges for the population and environment post-disaster, while maintaining an asset-based approach that supported hope in participants.

The data suggested a positive overall response to training and desire for additional information in problem-solving therapy and PTSD. Participants valued confidentiality training. Depression screening was implemented by many participants and was often report-

</table>
| What did CHWs think of the training and materials? | “Training was well done, well put together, very informative and educational for those who wouldn’t have as much knowledge on a particular subject.”  
“The role-playing on how to deal with difficult clients was very interesting.” |
| What components are CHWs using? | “Several of our workers have used the PHQ-2.”  
“Paraphrasing (screening items), so we could understand each other.”  
“I suggest they go to a clinic because I don’t want them to say I said they have ‘such and such.’  
When they come back I ask about the visit and then ask the questions and present the options.” |
| Confidentiality tools | “Confidentiality materials were helpful, especially HIPAA laws.” |
| Behavioral activation | “Elderly man who develops a plan to get off bus one block early to return to exercise, feels better; then gets off 2 blocks early and runs into a friend.” |
| How can CHW training and support materials be improved? | “The form is too long, break it down. Some questions need to be eliminated.”  
“Spanish version or simplified version for folks with low education.”  
“Would like a more community-oriented approach and language.” |
| Case registry | “People need more practice and a practice session is very helpful.” |
| Cultural competence | “Needs to be a greater effort to get them all to talk. Have everybody exchange phone numbers and have some conversations.” |
| More role playing | “Having recently trained counselor run support group for outreach workers.” |
| More relationship building | “You created an artificial distinction between counseling and outreach piece, that didn’t work (for our needs in mental health agency).” |
| Therapy for CHWs | “Confidentiality materials were helpful, especially HIPAA laws.” |
| Integrate with counseling skills | “Elderly man who develops a plan to get off bus one block early to return to exercise, feels better; then gets off 2 blocks early and runs into a friend.” |
| What are the challenges associated with implementing the CHW role? | “Reluctance to call police because of the way they handle it sometimes.”  
“Limited hospital services.”  
“Long wait for buses.”  
“We get the ‘I’m not crazy.’”  
“Denial issues.”  
“People don’t want to go to care.”  
“When we try to get people to accept some responsibility, people get upset with us and report us to the front office.” |
| Community infrastructure | “Catch me if you can’ clients.”  
“When I called her the following week, have not been able to get through.”  
“Try to reach family to follow-up with elderly.”  
“Clients dealing with multiple issues—health is last.”  
“Problems on top of problems.” |
| Client resistance and denial | “Management is not on the same page.” |
| Hard-to-reach clients and clients with complex issues | “Don’t have the interrelationships within and between agencies.”  
“Still trying to collaborate (to find a) place we can refer our clients.”  
“Outreach workers could work more closely with providers, churches.” |
| Job conditions | “It gives us all hope…It’s good that you started that process.”  
“The most important thing is that we stay in touch to make sure we are working on the same basis so we can all help each other.”  
“We increased ease of getting help for clients, working with other agencies.”  
“Do a resource network of mental health and rehabilitation providers. That would be a great service you could do.” |
| Agency relationships and provider collaboration | “Our agency pre-Katrina, failed Joint Commission because we did not do this. They will look to see if you have things like this in your program.” |
| What is the early impact? | “Helps set our own standards, better opportunity to shine, clarify ourselves, and get more money.” |
| Hope | “First time realized these providers want to do well.” |
| Networking | “First time realized these providers want to do well.” |
This intervention may offer an important resource for underserved communities to address mental health disparities following major disasters, as a complement to implementation of collaborative care programs in healthcare settings.

In summary, we found that it was possible to use a community-partnered, participatory research approach to design, implement, and evaluate feasibility of a CHW mental health outreach training program built on evidence-based practices in post-disaster New Orleans. Preliminary data support the acceptability and feasibility of implementation of most components, including novel features such as behavioral activation. We recommend ongoing program development supported by community input, as well as a formal evaluation to determine effectiveness of the model. This intervention may offer an important resource for underserved communities to address mental health disparities following major disasters, as a complement to implementation of collaborative care programs in healthcare settings.
